Introduction

Welcome to the IKS-6726-8PoE, a managed redundant PoE Gigabit Ethernet switch designed especially for connecting Ethernet-enabled devices for industrial field applications.

The following topics are covered in this chapter:

- **Overview**
- **Package Checklist**
- **Software Features**

Overview

The IKS-6726-8PoE can be used for Gigabit or Fast Ethernet backbones and supports redundant ring topologies. It allows PoE ports to supply power to PD devices in PoE applications. It also supports dual power inputs (24/48 VDC or 110/220 VDC/VAC) to increase the reliability of communication. The IKS-6726-8PoE has a modular design that makes network planning easy and allows greater flexibility. You can install up to 2 Gigabit Ethernet ports, 24 Fast Ethernet ports, and 16 PoE ports.

Package Checklist

The IKS-6726-8PoE is shipped with the following items. If any of these items is missing or damaged, please contact your customer service representative for assistance.

- 1 Moxa IKS-6726-8PoE
- Hardware installation guide
- CD-ROM with user's manual and SNMP MIB file
- Warranty statement
- RJ45-to-DB9 console port cable
- Protective caps for unused ports
- Rackmount ears

Software Features

- IPv6 Ready logo awarded (IPv6 Logo Committee certified)
- IEEE 1588 PTP (Precision Time Protocol) for precise time synchronization of networks
- DHCP Option 82 for IP address assignment with different policies
- Modbus/TCP industrial Ethernet protocol supported
- Turbo Ring and Turbo Chain (recovery time < 20 ms at full load) and RSTP/STP (IEEE 802.1w/D)
- IGMP snooping and GMRP for filtering multicast traffic
- Port-based VLAN, IEEE 802.1Q VLAN, and GVRP to ease network planning
- QoS (IEEE 802.1p/1Q) and TOS/DiffServ to increase determinism
- Port Trunking for optimum bandwidth utilization
- IEEE 802.1X, HTTPS, and SSH to enhance network security
- SNMPv1/v2c/v3 for different levels of network management
- RMON for efficient network monitoring and proactive capability
- Bandwidth management prevents unpredictable network status
- Lock port function for blocking unauthorized access based on MAC address
- Port mirroring for online debugging
- Automatic warning by exception through e-mail, relay output
- Digital inputs to integrate sensors and alarms with IP networks

2

Getting Started

This chapter explains how the initial installation process for the IKS-6726-8PoE. There are three ways to access IKS-6726-8PoE's configuration settings: the serial console, Telnet console, and web console. If you do not know the IKS-6726-8PoE's IP address, you can open the serial console by connecting the IKS-6726-8PoE to a PC's COM port with a short serial cable. You can open the Telnet or web console over an Ethernet LAN or over the Internet.

The following topics are covered in this chapter:

- **Serial Console Configuration (115200, None, 8, 1, VT100)**
- **Configuration by Telnet Console**
- **Configuration by Web Browser**
- **Disabling Telnet and Browser Access**

Serial Console Configuration (115200, None, 8, 1, VT100)

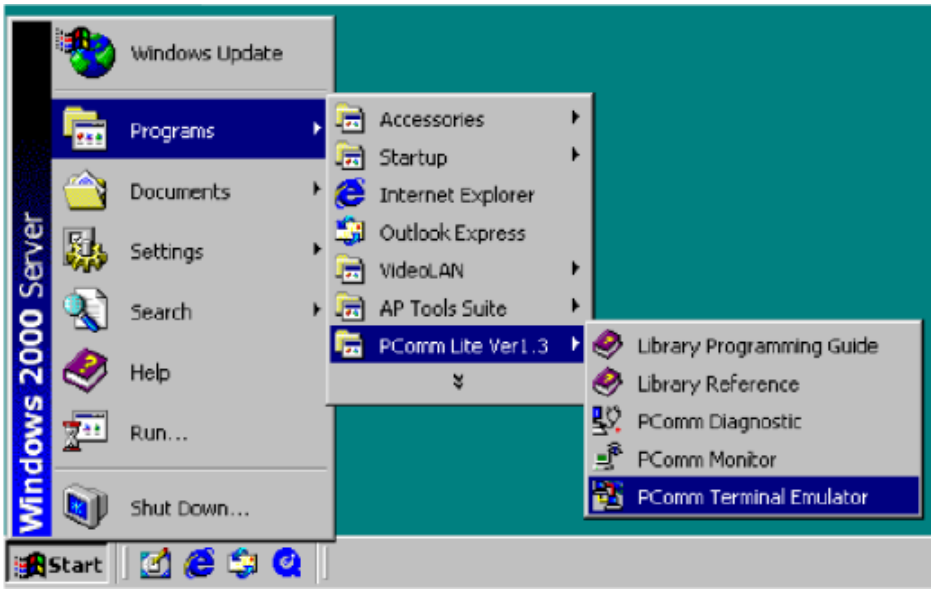
NOTE You cannot connect to the serial and Telnet console at the same time.
You can connect to the web console and another console (serial or Telnet) at the same time.
However, it is strongly recommended that you do NOT do so. Following this advice will allow you to maintain better control over the IKS-6726-8PoE's configuration.

NOTE We recommend using PComm Terminal Emulator when opening the serial console. This software can be downloaded free of charge from the Moxa website.

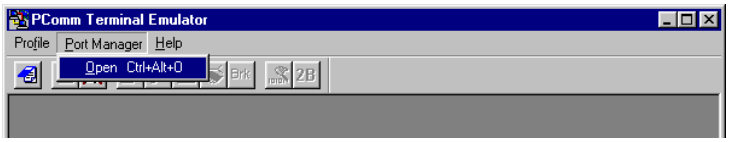
Before running PComm Terminal Emulator, use an RJ45 to DB9-F (or RJ45 to DB25-F) cable to connect the IKS-6726-8PoE's console port to your PC's COM port (generally COM1 or COM2, depending on how your system is set up).

After installing PComm Terminal Emulator, open the IKS-6726-8PoE's serial console as follows:

1. From the Windows desktop, click **Start** → **Programs** → **PComm Lite 1.3** → **Terminal Emulator**.

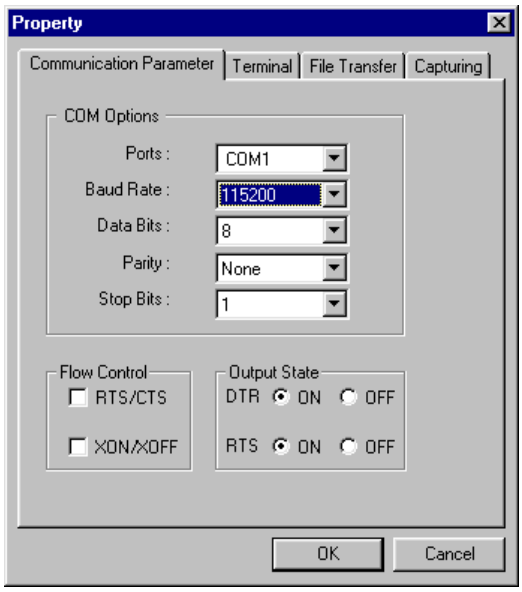


2. Select **Open** under the **Port Manager** menu to open a new connection.

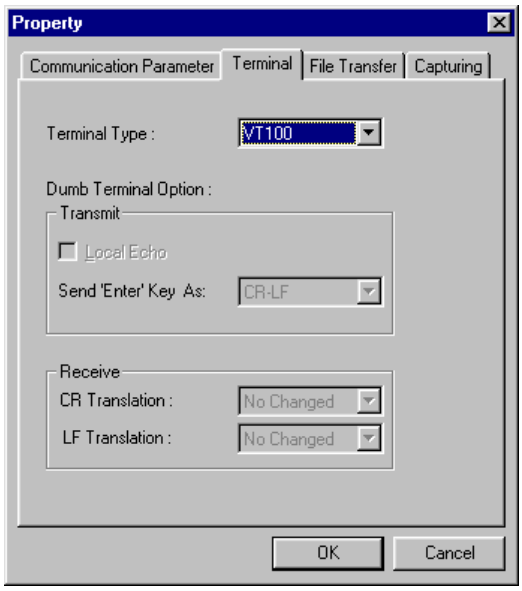


3. The **Property** window should open. On the **Communication Parameter** tab for **Ports**, select the COM port that is being used for the console connection. Set the other fields as follows: **115200** for **Baud Rate**,

8 for **Data Bits**, **None** for **Parity**, and **1** for **Stop Bits**.



4. On the **Terminal** tab, select **VT100** for **Terminal Type**. Click **OK**.

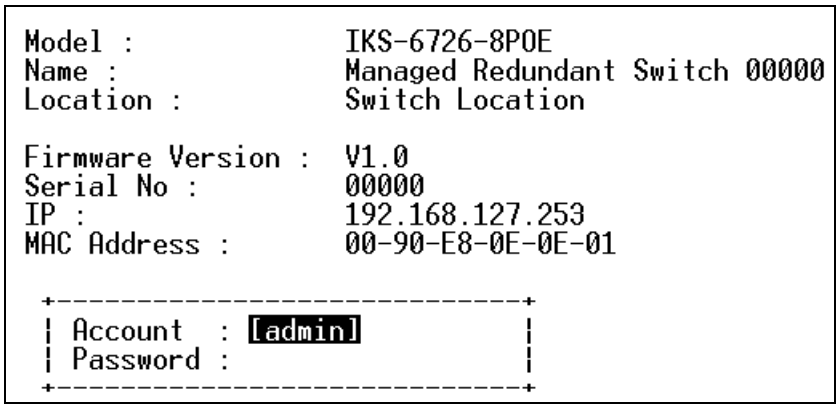


5. In the terminal window, the IKS-6726-8PoE will prompt you to select a terminal type. Enter **1** to select **ansi/vt100** and press **Enter**.

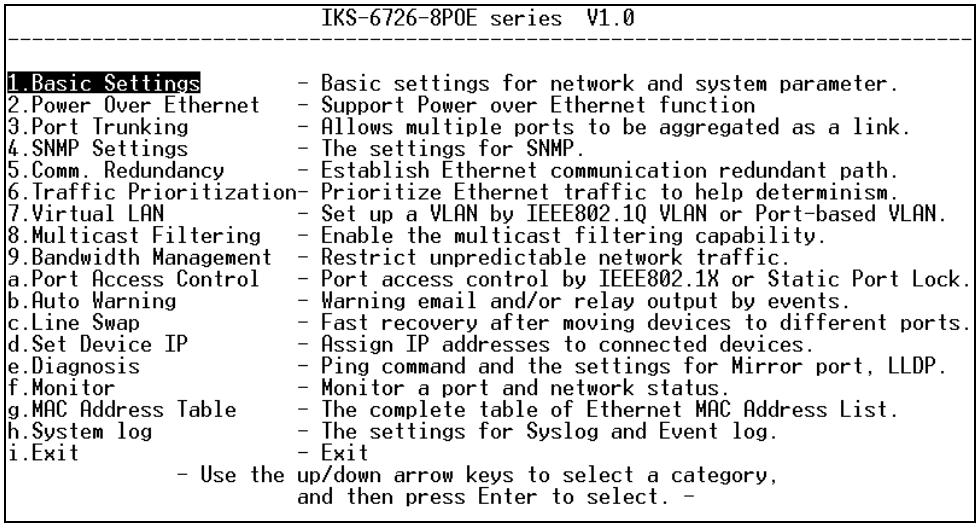
```
MOXA EtherDevice Switch  IKS-6726-8POE
Console terminal type (1: ansi/vt100, 2: vt52) : 1
```

6. The serial console will prompt you to log in. Press **Enter** and select **admin** or **user**. Use the down arrow key on your keyboard to select the **Password** field and enter a password if desired. This password will be required to access any of the consoles (web, serial, Telnet). If you do not wish to create a password, leave

the **Password** field blank and press **Enter**.



7. The **Main Menu** of the IKS-6726-8PoE's serial console should appear. (In PComm Terminal Emulator, you can adjust the font by selecting **Font...** in the **Edit** menu.)



8. Use the following keys on your keyboard to navigate the IKS-6726-8PoE's serial console:

Key	Function
Up, down, right, left arrow keys Tab	Move the onscreen cursor
Enter	Display and select options
Space	Toggle options
Esc	Previous menu

Configuration by Telnet Console

You may open the IKS-6726-8PoE's Telnet or web console over a network. This requires that the PC host and IKS-6726-8PoE are on the same logical subnet. You may need to adjust your PC host's IP address and subnet mask. By default, the IKS-6726-8PoE's IP address is 192.168.127.253 and IKS-6726-8PoE's subnet mask is 255.255.255.0 (for a Class B network). This means that your PC's IP address must be set to 192.168.xxx.xxx for a subnet mask of 255.255.0.0, or to 192.168.127.xxx with a subnet mask of 255.255.255.0.

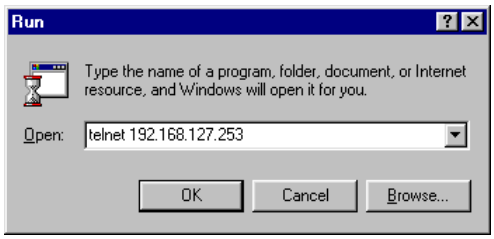
NOTE To connect to the IKS-6726-8PoE's Telnet or web console, your PC host and the IKS-6726-8PoE must be on the same logical subnet.

NOTE When connecting to the IKS-6726-8PoE's Telnet or web console, first connect one of IKS-6726-8PoE's Ethernet ports to your Ethernet LAN or directly to your PC's Ethernet port. You may use either a straight-through or cross-over Ethernet cable.

NOTE The IKS-6726-8PoE's default IP address is 192.168.127.253.

After making sure that the IKS-6726-8PoE is connected to the same LAN and logical subnet as your PC, open the IKS-6726-8PoE's Telnet console as follows:

1. Click **Start** → **Run** from the Windows Start menu. Telnet to the IKS-6726-8PoE's IP address from the Windows Run window. You may also issue the Telnet command from a DOS prompt.



2. In the terminal window, the Telnet console will prompt you to select a terminal type. Type **1** to choose **ansi/vt100**, and then press **Enter**.

```
MOXA EtherDevice Switch  IKS-6726-8POE
Console terminal type (1: ansi/vt100, 2: vt52) : 1
```

3. The Telnet console will prompt you to log in. Press **Enter** and select **admin** or **user**. Use the down arrow key on your keyboard to select the **Password** field and enter a password if desired. This password will be required to access any of the consoles (web, serial, Telnet). If you do not wish to create a password, leave the **Password** field blank and press **Enter**.

```
Model :                 IKS-6726-8POE
Name :                  Managed Redundant Switch 00000
Location :              Switch Location

Firmware Version :      V1.0
Serial No :             00000
IP :                    192.168.127.253
MAC Address :           00-90-E8-0E-0E-01

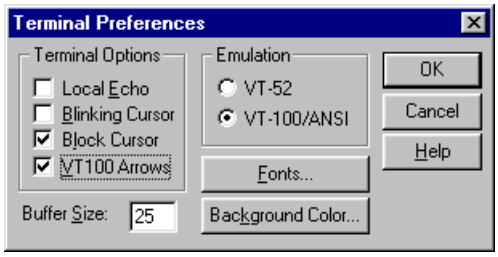
 +------------------------------+
 | Account  : [admin]           |
 | Password :                   |
 +------------------------------+
```

4. The **Main Menu** of the IKS-6726-8PoE's Telnet console should appear.

```
                          IKS-6726-8POE series  V1.0
------------------------------------------------------------------------------

1.Basic Settings          - Basic settings for network and system parameter.
2.Power Over Ethernet     - Support Power over Ethernet function
3.Port Trunking           - Allows multiple ports to be aggregated as a link.
4.SNMP Settings           - The settings for SNMP.
5.Comm. Redundancy        - Establish Ethernet communication redundant path.
6.Traffic Prioritization- Prioritize Ethernet traffic to help determinism.
7.Virtual LAN             - Set up a VLAN by IEEE802.1Q VLAN or Port-based VLAN.
8.Multicast Filtering     - Enable the multicast filtering capability.
9.Bandwidth Management    - Restrict unpredictable network traffic.
a.Port Access Control     - Port access control by IEEE802.1X or Static Port Lock.
b.Auto Warning            - Warning email and/or relay output by events.
c.Line Swap               - Fast recovery after moving devices to different ports.
d.Set Device IP           - Assign IP addresses to connected devices.
e.Diagnosis               - Ping command and the settings for Mirror port, LLDP.
f.Monitor                 - Monitor a port and network status.
g.MAC Address Table       - The complete table of Ethernet MAC Address List.
h.System log              - The settings for Syslog and Event log.
i.Exit                    - Exit
              - Use the up/down arrow keys to select a category,
                          and then press Enter to select. -
```

5. In the terminal window, select **Preferences...** from the **Terminal** menu on the menu bar. The **Terminal Preferences** window should appear. Make sure that **VT100 Arrows** is checked.



6. Use the following keys on your keyboard to navigate the IKS-6726-8PoE's Telnet console:

Key	Function
Up, down, right, left arrow keys Tab	Move the onscreen cursor
Enter	Display and select options
Space	Toggle options
Esc	Previous menu

NOTE The Telnet console looks and operates in precisely the same manner as the serial console.

Configuration by Web Browser

The IKS-6726-8PoE's web console is a convenient way to modify the configuration and access the built-in monitoring and network administration functions. You can open the IKS-6726-8PoE's web console using a standard web browser such as Internet Explorer or Netscape.

NOTE To connect to the IKS-6726-8PoE's Telnet or web console, your PC host and the IKS-6726-8PoE must be on the same logical subnet.

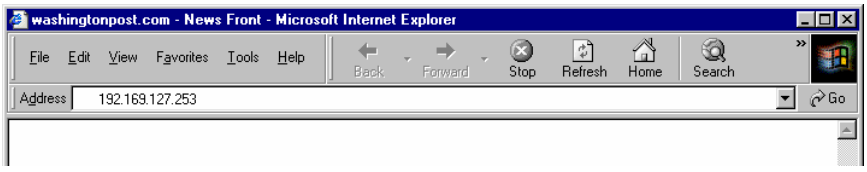
NOTE If the IKS-6726-8PoE is configured for other VLAN settings, you must make sure your PC host is on the management VLAN.

NOTE When connecting to the IKS-6726-8PoE's Telnet or web console, first connect one of IKS-6726-8PoE's Ethernet ports to your Ethernet LAN or directly to your PC's Ethernet port. You may use either a straight-through or cross-over Ethernet cable.

NOTE The IKS-6726-8PoE's default IP address is 192.168.127.253.

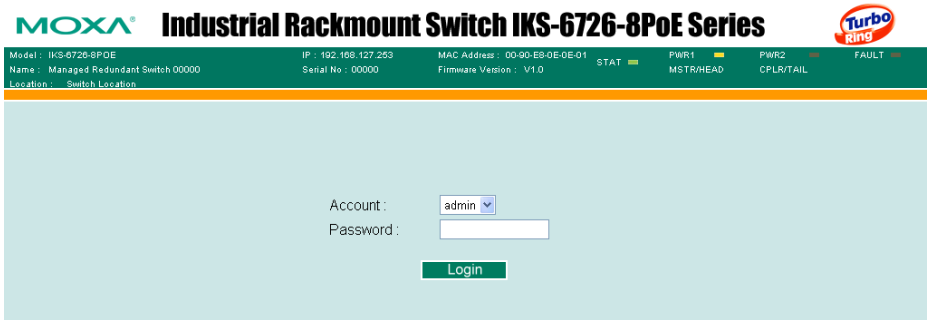
After making sure that the IKS-6726-8PoE is connected to the same LAN and logical subnet as your PC, open the IKS-6726-8PoE's web console as follows:

1. Point your web browser to the IKS-6726-8PoE's IP address by entering it in the **Address** or **URL** field.



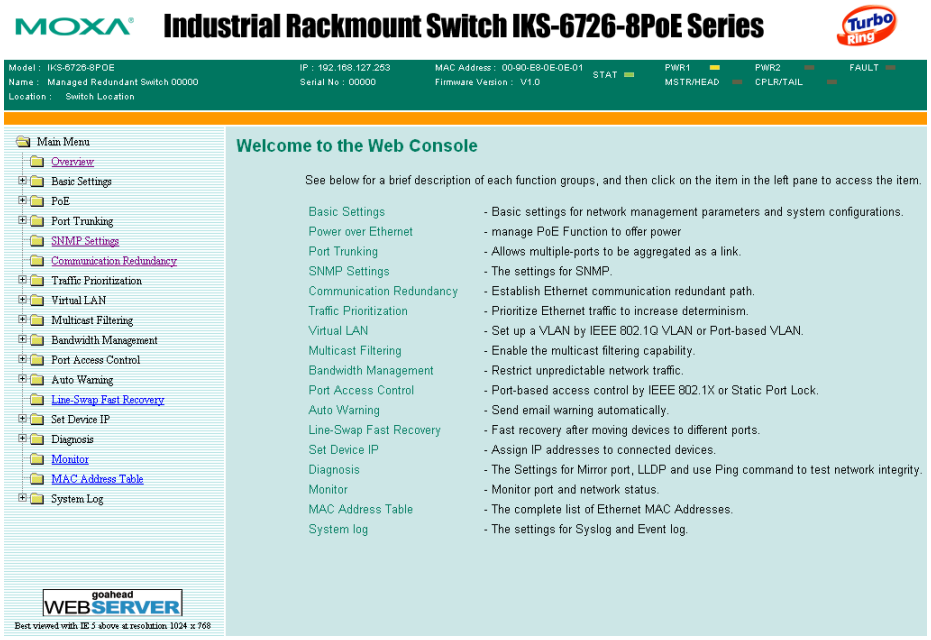
2. The IKS-6726-8PoE's web console will open, and you will be prompted to log in. Select the login account (admin or user) and enter the **Password**. This password will be required to access any of the consoles (web,

serial, Telnet). If you do not wish to create a password, leave the **Password** field blank and press **Enter**.



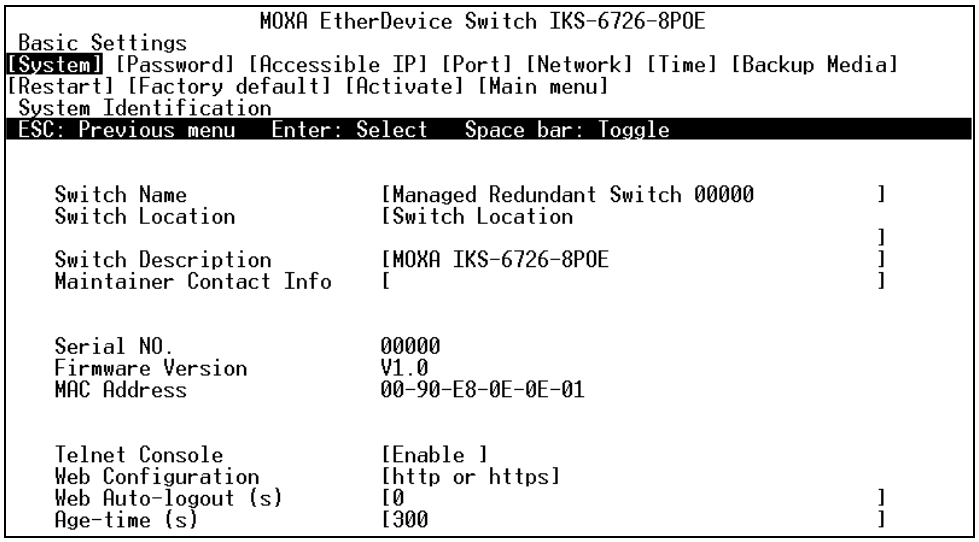
NOTE By default, no password is assigned to the IKS-6726-8PoE's web, serial, and Telnet consoles.

3. After logging in, you may need to wait a few moments for the web console to appear. Use the folders in the left navigation panel to navigate between different pages of configuration options.



Disabling Telnet and Browser Access

If you are connecting the IKS-6726-8PoE to a public network but do not intend to manage it over the network, we suggest disabling both the Telnet and web consoles. This is done through the serial console, by navigating to **System Identification** under **Basic Settings**. Disable or enable the **Telnet Console** and **Web Configuration** as shown below:



MOXA EtherDevice Switch IKS-6726-8POE
Basic Settings
[System] [Password] [Accessible IP] [Port] [Network] [Time] [Backup Media]
[Restart] [Factory default] [Activate] [Main menu]

Web Auto-logout (s) [0]
Age-time (s) [300]

3

Featured Functions

This chapter explains how to access IKS-6726-8PoE's various configuration, monitoring, and administration functions. These functions can be accessed by serial, Telnet, or web console. The serial console can be used if you do not know IKS-6726-8PoE's IP address and requires that you connect the IKS-6726-8PoE to a PC COM port. The Telnet and web consoles can be opened over an Ethernet LAN or the Internet.

The web console is the most user-friendly way to configure IKS-6726-8PoE. In this chapter, we use the web console interface to introduce the functions. There are only a few differences between the web console, serial console, and Telnet console.

The following topics are covered in this chapter:

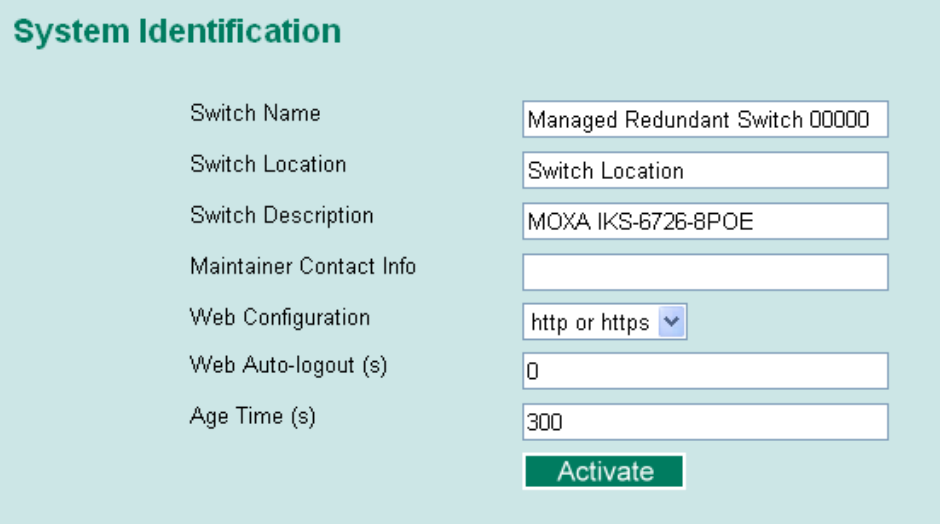
- **Configuring Basic Settings**
- **Using PoE**
- **Using Port Trunking**
- **Configuring SNMP**
- **Using Communication Redundancy**
- **Using Traffic Prioritization**
- **Using Virtual LAN**
- **Using Multicast Filtering**
- **Using Bandwidth Management**
- **Configuring Bandwidth Management**
- **Using Port Access Control**
- **Using Auto Warning**
- **Configuring Email Warning**
- **Using Line-Swap-Fast-Recovery**
- **Using Set Device IP**
- **Using Diagnosis**
- **Using Monitor**
- **Using the MAC Address Table**
- **Using Event Log**
- **Using Syslog**
- **Using HTTPS/SSL**

Configuring Basic Settings

Basic Settings includes the most common settings required by administrators to maintain and control the IKS-6726-8PoE.

System Identification

System Identification items are displayed at the top of the web console and will be included in alarm emails. You can set the System Identification items to make it easier to identify different switches that are connected to your network.



Switch Name

Setting	Description	Factory Default
Max. 30 characters	This option is useful for differentiating between the roles or applications of different units. Example: Factory Switch 1.	Managed Redundant Switch [Serial no. of this switch]

Switch Location

Setting	Description	Factory Default
Max. 80 characters	This option is useful for differentiating between the locations of different units. Example: production line 1.	Switch Location

Switch Description

Setting	Description	Factory Default
Max. 30 characters	This option is useful for recording a more detailed description of the unit.	None

Maintainer Contact Info

Setting	Description	Factory Default
Max. 30 characters	This option is useful for providing information about who is responsible for maintaining this unit and how to contact this person.	None

Web Auto-logout(s)

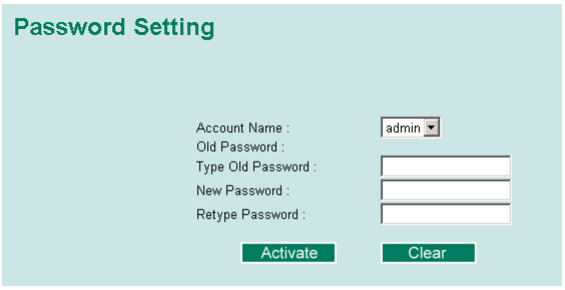
Setting	Description	Factory Default
60 to 86400 (seconds)	Disable or extend the auto-logout time for the web management console.	0 (disable)

Age time(s)

Setting	Description	Factory Default
15 to 3825 (seconds)	The length of time that a MAC address entry can remain in the Moxa switch. When an entry reaches its aging time, it "ages out" and is purged from the switch, effectively cancelling frame forwarding to that specific port.	300

Password

The IKS-6726-8PoE provides two levels of configuration access. The **admin** account has read/write access of all configuration parameters, and the **user** account has read access only. The **user** account can only view the configuration, but will not be able to make modifications.



ATTENTION

By default, no password is assigned to the IKS-6726-8PoE's web, Telnet, and serial consoles. If a password is assigned, you will be required to enter the password when you open the serial console, Telnet console, or Web console.

Account

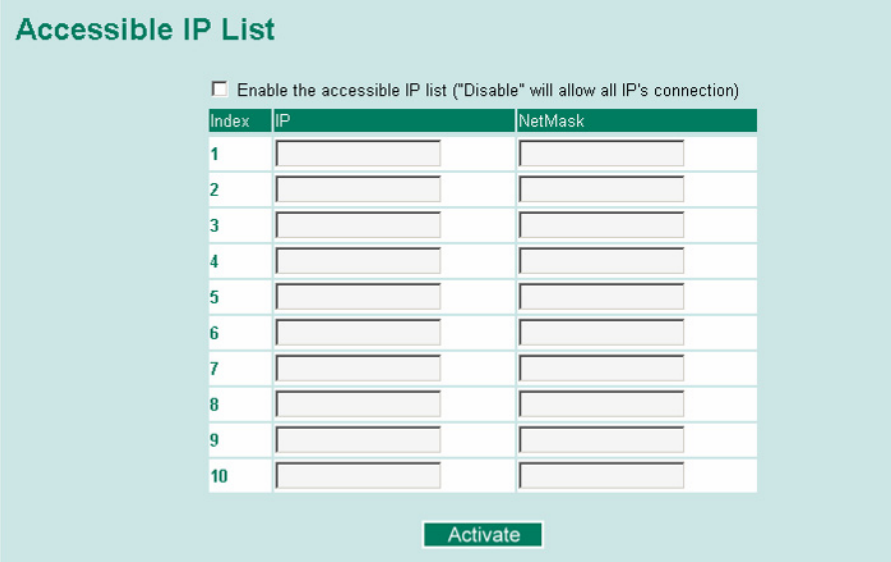
Setting	Description	Factory Default
Admin	This account can modify the IKS-6726-8PoE's configuration.	admin
User	This account can only view the IKS-6726-8PoE's configurations.	

Password

Setting	Description	Factory Default
Old password (max. 16 characters)	Enter the current password	None
New password (Max. 16 characters)	Enter the desired new password. Leave it blank if you want to remove the password.	None
Retype password (Max. 16 characters)	Enter the desired new password again. Leave it blank if you want to remove the password.	None

Accessible IP

The IKS-6726-8PoE uses an IP address-based filtering method to control access.



You may add or remove IP addresses to limit access to the IKS-6726-8PoE. When the accessible IP list is enabled, only addresses on the list will be allowed access to the IKS-6726-8PoE. Each IP address and netmask entry can be tailored for different situations:

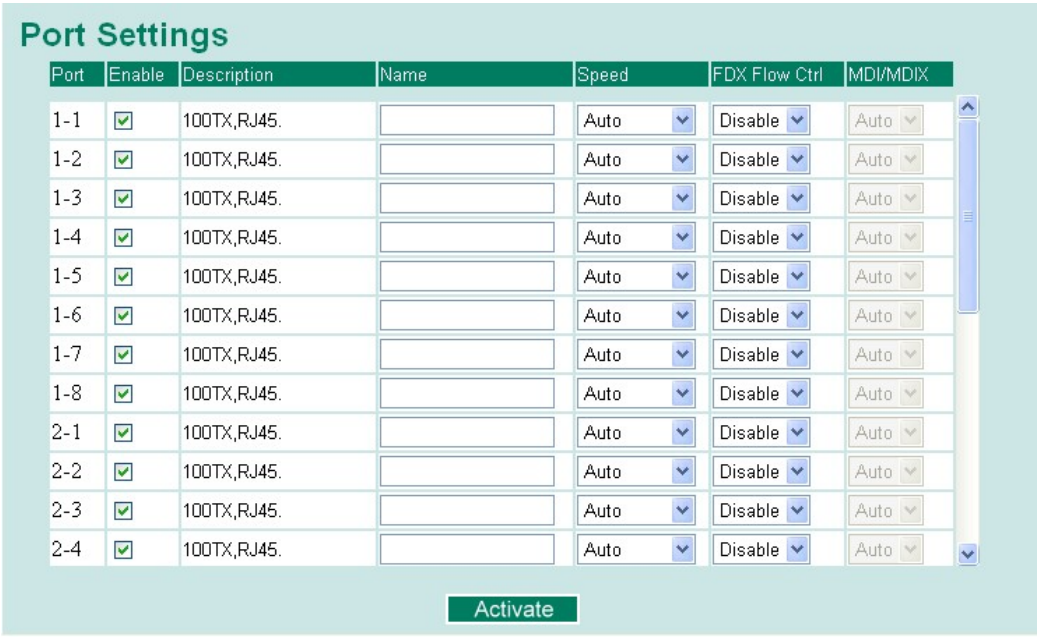
- **Grant access to one host with a specific IP address**
  For example, enter IP address 192.168.1.1 with netmask 255.255.255.255 to allow access to 192.168.1.1 only.
- **Grant access to any host on a specific subnetwork**
  For example, enter IP address 192.168.1.0 with netmask 255.255.255.0 to allow access to all IPs on the subnet defined by this IP address/subnet mask combination.
- **Grant acces to all hosts**
  Make sure the accessible IP list is not enabled. Remove the checkmark from **Enable the accessible IP list**.

The following table shows additional configuration examples:

Hosts That Need Access	Input Format
Any host	Disable
192.168.1.120	192.168.1.120 / 255.255.255.255
192.168.1.1 to 192.168.1.254	192.168.1.0 / 255.255.255.0
192.168.0.1 to 192.168.255.254	192.168.0.0 / 255.255.0.0
192.168.1.1 to 192.168.1.126	192.168.1.0 / 255.255.255.128
192.168.1.129 to 192.168.1.254	192.168.1.128 / 255.255.255.128

Port

Port settings are included to give the user control over port access, port transmission speed, flow control, and port type (MDI or MDIX).



Enable

Setting	Description	Factory Default
Checked	This allows data transmission through the port.	Enabled
Unchecked	This immediately shuts off port access.	

ATTENTION

If a connected device or sub-network is wreaking havoc on the rest of the network, the **Disable** option under **Advanced Settings/Port** gives the administrator a quick way to shut off access through this port immediately.

Description

Setting	Description	Factory Default
Media type	This displays the media type for each module's port	N/A

Name

Setting	Description	Factory Default
Max. 63 characters	This specifies an alias for the port to help administrators differentiate between different ports. Example: PLC 1	None

Speed

Setting	Description	Factory Default
Auto	This allows the port to use the IEEE 802.3u protocol to negotiate with connected devices. The port and connected devices will determine the best speed for that connection.	Auto
100M-Full	Choose one of these fixed speed options if the connected Ethernet device has trouble auto-negotiating for line speed.	
100M-Half		
10M-Full		
10M-Half		

FDX Flow Ctrl

This setting enables or disables flow control for the port when the port's Speed is set to Auto. The final result will be determined by the Auto process between the IKS-6726-8PoE and connected devices.

Setting	Description	Factory Default
Enable	This enables flow control for this port when the port's Speed is set to Auto.	Disable

Disable	This disables flow control for this port when the port's Speed is set to Auto.	

MDI/MDIX

Setting	Description	Factory Default
Auto	This allows the port to auto-detect the port type of the connected Ethernet device and change the port type accordingly.	Auto
MDI	Choose MDI or MDIX if the connected Ethernet device has trouble auto-negotiating for port type.	
MDIX		

Network

The **Network** configuration allows users to configure both IPv4 and IPv6 parameters for management access over the network. The IKS-6726-8PoE series supports both IPv4 and IPv6, and can be managed through either of these address types.

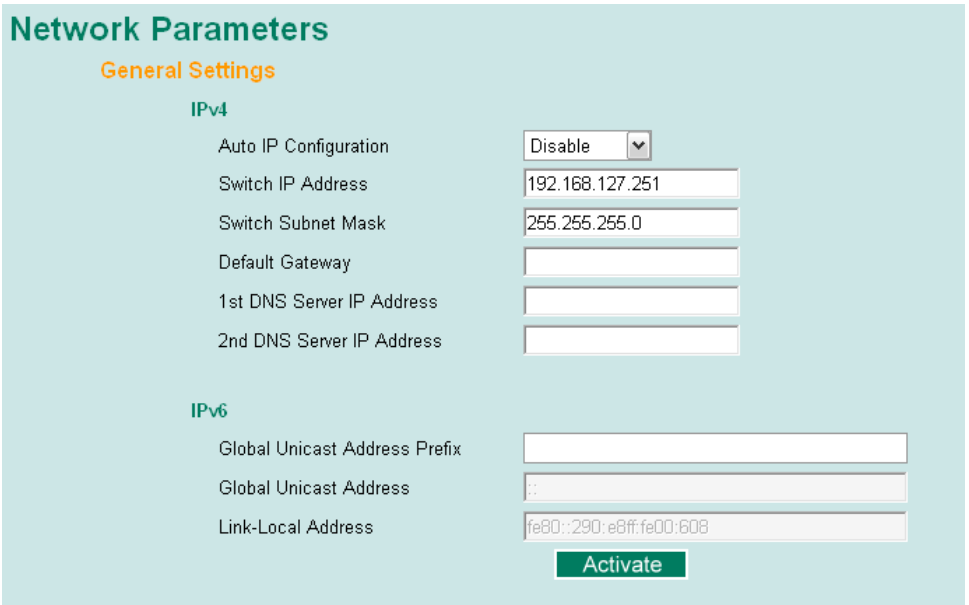
IPv4

The IPv4 settings include the switch's IP address and subnet mask, as well as the IP address of the default gateway. In addition, input cells are provided for the IP addresses of a 1st and 2nd DNS server.

IPv6

The IPv6 settings include two distinct address types—Link-Local Unicast addresses and Global Unicast addresses. A Link-Local address makes the switch accessible over IPv6 for all devices attached to the same local subnet. To connect to a larger network with multiple segments, the switch must be configured with a Global Unicast address.

A brief explanation of each configuration item is given below.



Global Unicast Address Prefix (Prefix Length: 64 bits)

Setting	Description	Factory Default
Global Unicast Address Prefix	The prefix value must be formatted according to RFC 2373 "IPv6 Addressing Architecture," using 8 colon-separated 16-bit hexadecimal values. One double colon may be used in the address to indicate the appropriate number of zeros required to fill the undefined fields.	None

Global Unicast Address

Setting	Description	Factory Default
None	Displays the IPv6 Global Unicast address. The network portion of the Global Unicast address can be configured by specifying the Global Unicast Prefix and using a EUI-64 interface ID in the low order 64 bits. The host portion of the Global Unicast address is automatically generated using the modified EUI-64 form of the interface identifier (Switch's MAC address)	None

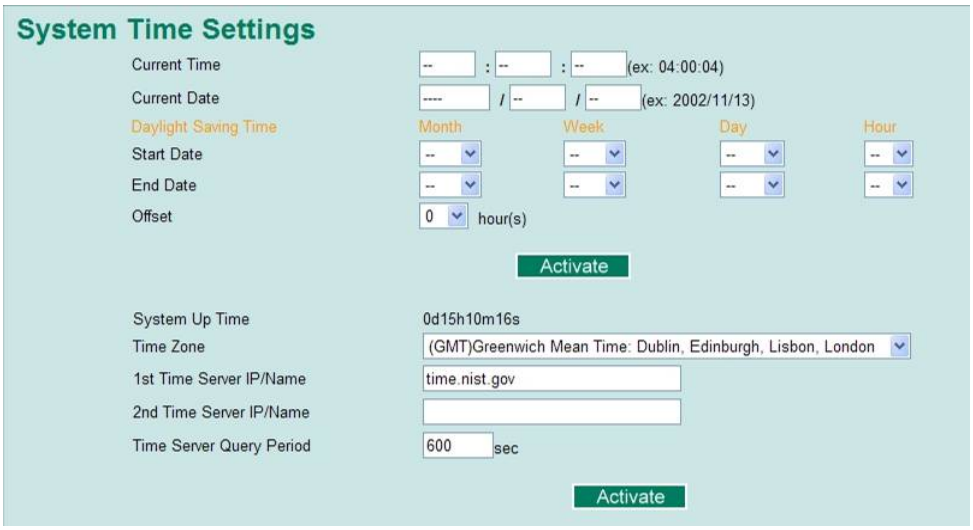
Link-Local Address

Setting	Description	Factory Default
None	The network portion of the Link-Local address is FE80 and the host portion of the Link-Local address is automatically generated using the modified EUI-64 from of the interface identifier (Switch's MAC address)	FE80: (EUI-64 form of the MAC address)

Neighbor Cache

Setting	Description	Factory Default
None	The information in the neighbor cache that includes the neighboring node's IPv6 address, the corresponding Link-Layer address, and the current state of the entry.	None

Time



The IKS-6726-8PoE has a time calibration function based on information from an NTP server or user specified time and date. Functions such as automatic warning emails can therefore include time and date stamp.

NOTE The IKS-6726-8PoE have a real time clock so the user doesn't need to update the **Current Time** and **Current Date** to set the initial time for the IKS-6726-8PoE after each reboot, especially when the network does not have an Internet connection for an NTP server or there is no NTP server on the LAN.

Current Time

Setting	Description	Factory Default
User-specified time	This allows configuration of the local time in local 24-hour format.	None

Current Date

Setting	Description	Factory Default
User-specified date	This allows configuration of the local date in yyyy-mm-dd format.	None

Daylight Saving Time

The Daylight Saving Time settings are used to automatically offset the IKS-6726-8PoE's time forward according to national standards.

Start Date

Setting	Description	Factory Default
User-specified date	This specifies the date that Daylight Savings Time begins.	None

End Date

Setting	Description	Factory Default
User-specified date	This specifies the date that Daylight Savings Time ends.	None

Offset

Setting	Description	Factory Default
User-specified hour	This specifies the number of hours that the time should be offset forward during Daylight Savings Time.	None

System Up Time

This indicates how long the IKS-6726-8PoE remained up since the last cold start. The up time is indicated in seconds.

Time Zone

Setting	Description	Factory Default
Time zone	This specifies the time zone, which is used to determine the local time offset from GMT (Greenwich Mean Time).	GMT (Greenwich Mean Time)

NOTE Changing the time zone will automatically correct the current time. Make sure to set the time zone before setting the time.

Time Server IP/Name

Setting	Description	Factory Default
IP address or name of time server	This is the IP or domain address (e.g., 192.168.1.1, time.stdtime.gov.tw, or time.nist.gov).	None
IP address or name of secondary time server	The IKS-6726-8PoE will try to locate the secondary NTP server if the first NTP server fails to connect.	

Time Server Query Period

Setting	Description	Factory Default
Query period	This parameter determines how frequently the time is updated from the NTP server.	600 seconds

IEEE 1588 PTP

The following information is taken from the NIST website at http://ieee1588.nist.gov/intro.htm:

"Time measurement can be accomplished using the IEEE Standard for a Precision Clock Synchronization Protocol for Networked Measurement and Control Systems (IEEE 1588-2008) to synchronize real-time clocks incorporated within each component of the electrical power system for power automation applications.

IEEE 1588, which was published in November 2002, expands the performance capabilities of Ethernet networks to control systems that operate over a communication network. In recent years an increasing number of electrical power systems have been using a more distributed architecture with network technologies that have less stringent timing specifications. IEEE 1588 generates a master-slave relationship between the clocks, and enforces the specific timing requirements in such power systems. All devices ultimately get their time from a clock known as the grandmaster clock. In its basic form, the protocol is intended to be administration free."

How does an Ethernet Switch Affect 1588 Synchronization?

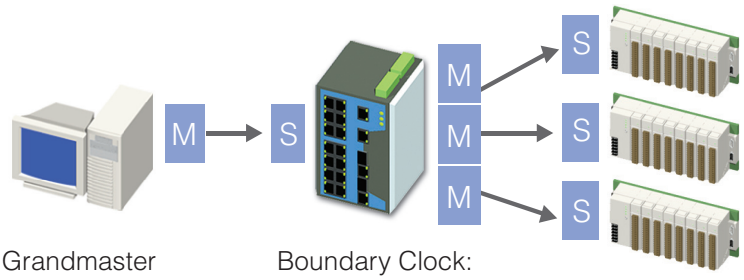
The following content is taken from the NIST website at http://ieee1588.nist.gov/switch.htm:

"An Ethernet switch potentially introduces multi-microsecond fluctuations in the latency between the 1588 grandmaster clock and a 1588 slave clock. Uncorrected these fluctuations will cause synchronization errors. The magnitude of these fluctuations depend on the design of the Ethernet switch and the details of the communication traffic. Experiments with prototype implementations of IEEE 1588 indicate that with suitable care the effect of these fluctuations can be successfully managed. For example, use of appropriate statistics in the 1588 devices to recognized significant fluctuations and use suitable averaging techniques in the algorithms controlling the correction of the local 1588 clock will be the good design means to achieve the highest time accuracy."

Can Ethernet switches be designed to avoid the effects of these fluctuations?

A switch may be designed to support IEEE 1588 while avoiding the effects of queuing. In this case two modifications to the usual design of an Ethernet switch are necessary:

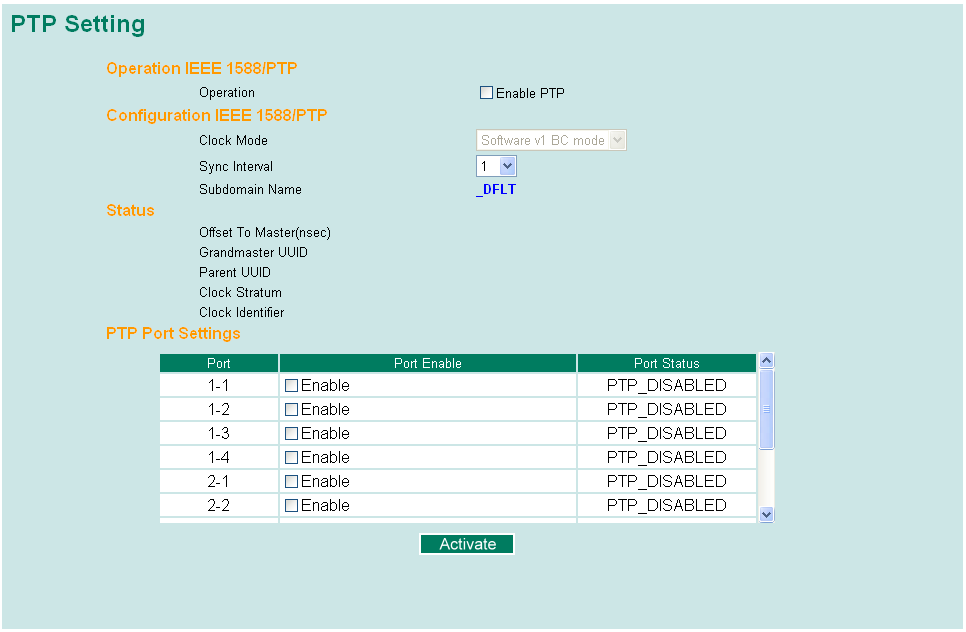
- The **Boundary Clock** functionality defined by IEEE 1588 must be implemented in the switch.
- The switch must be configured so that it does not pass IEEE 1588 message traffic using the normal communication mechanisms of the switch.
- Such an Ethernet switch will synchronize clocks directly connected to one of its ports to the highest possible accuracy.



Grandmaster Clock: Determines the time base for the system

Boundary Clock: Slave to the grandmaster clock and master to its slave

Ordinary Clock: Slave to its master



PTP Setting

Operation IEEE 1588/PTP

Setting	Description	Factory Default
Operation	Disable or enable IEEE 1588(PTP) operation	Disable

Configuration IEEE 1588/PTP

Setting	Description	Factory Default
Clock Mode	Support software-based IEEE 1588(PTP) mode	Disable
Sync Interval	Period for sending synchronization message (in seconds)	Disable
Sub-domain Name	Support _DFLT(Default) domain only	_DFLT

Status

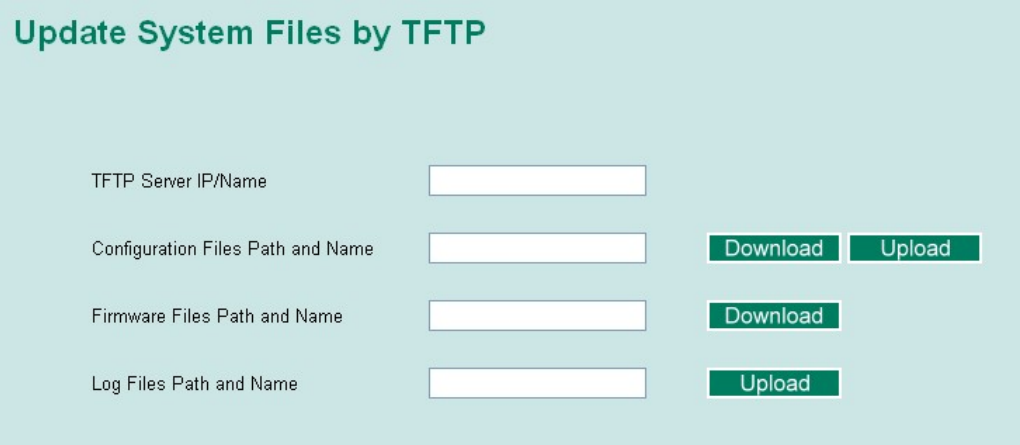
Setting	Description	Factory Default
Offset To Master (nsec)	Deviation between local time and the reference clock (in nanoseconds).	
Grandmaster UUID	When the clock has a port in PTP_SLAVE state, this member's value is the value of the grand master Clock's Uuid field of the last Sync message received from the parent of the slave port.	
Parent UUID	When the clock has a port in PTP_SLAVE state, this member's value is the value of the source-Uuid field of the last Sync message received from the parent of the slave port.	
Clock Stratum	The stratum number describes one measure of the quality of a clock. Each clock is characterized by a stratum number used by the best master clock algorithm as one parameter of clock quality.	4
Clock Identifier	Properties of the clock.	DFLT

PTP Port Settings

Setting	Description	Factory Default
Port Enable	Enable or disable PTP port operation.	None
Port Status	Display PTP port real status.	PTP_DISABLED

System File Update—By Remote TFTP

The IKS-6726-8PoE supports saving your configuration or log file to a remote TFTP server or local host. Other IKS-6726-8PoE switches can also load the configuration at a later time. The IKS-6726-8PoE also supports loading firmware or configuration files from the TFTP server or a local host.



TFTP Server IP/Name

Setting	Description	Factory Default
IP address of TFTP server	This specifies the IP address or name of the remote TFTP server. This must be specified before downloading or uploading files.	None

Configuration Files Path and Name

Setting	Description	Factory Default
Max. 40 characters	This specifies the path and file name of the IKS-6726-8PoE's configuration file on the TFTP server.	None

Firmware Files Path and Name

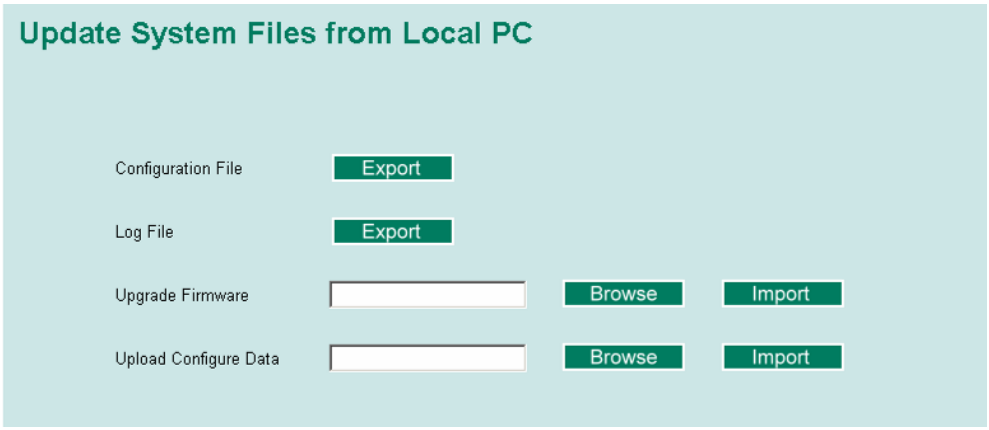
Setting	Description	Factory Default
Max. 40 characters	This specifies the path and file name of the IKS-6726-8PoE's firmware file.	None

Log Files Path and Name

Setting	Description	Factory Default
Max. 40 characters	This specifies the path and file name of the IKS-6726-8PoE's log file.	None

After setting the desired paths and file names. Click **Download** to download the prepared file from the remote TFTP server, or click **Upload** to upload the desired file to the remote TFTP server.

System File Update—By Local Import/Export



Configuration File

Click **Export** to save the IKS-6726-8PoE's configuration file to the local host.

Log File

Click **Export** to save the IKS-6726-8PoE's log file to the local host.

NOTE Some operating systems will open the configuration file and log file directly in the web page. In such cases, right click the Export button to save the file.

Upgrade Firmware

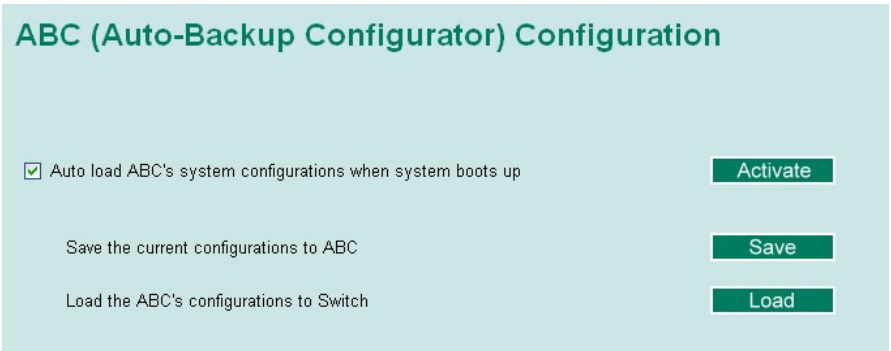
To import a new firmware file onto the IKS-6726-8PoE, click **Browse** to select the firmware file that is saved on your computer. The upgrade procedure will proceed automatically after clicking **Import**.

Upload Configure Data

To import a configuration file onto the IKS-6726-8PoE, click **Browse** to select the configuration file already saved on your computer. The upgrade procedure will proceed automatically after clicking **Import**.

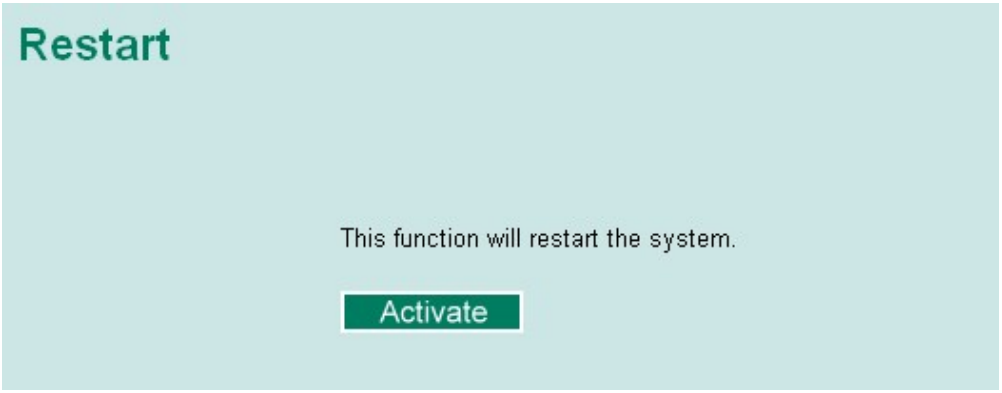
System File Update—By Backup Media

You can use Moxa's Automatic Backup Configurator to save and load the IKS-6726-8PoE's configurations through the switch's RS-232 console port.

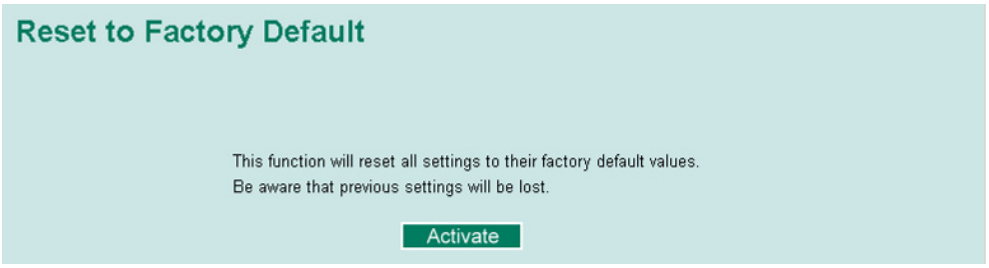


Restart

This function provides users with a quick way to restart the system.



Factory Default



This function provides users with a quick way of restoring the IKS-6726-8PoE's configuration to factory defaults. This function is available in the serial, Telnet, and web consoles.

NOTE After restoring the factory default configuration, you will need to use the default network settings to re-establish the web or Telnet console connection with the IKS-6726-8PoE.

Using PoE

Power over Ethernet has become increasingly popular due in large part to the reliability provided by PoE Ethernet switches that supply the necessary power to Powered Devices (PD) when AC power is not readily available or cost-prohibitive to provide locally.

Power over Ethernet can be used with:

- Surveillance cameras
- Security I/O sensors
- Industrial wireless access points
- Emergency IP phones

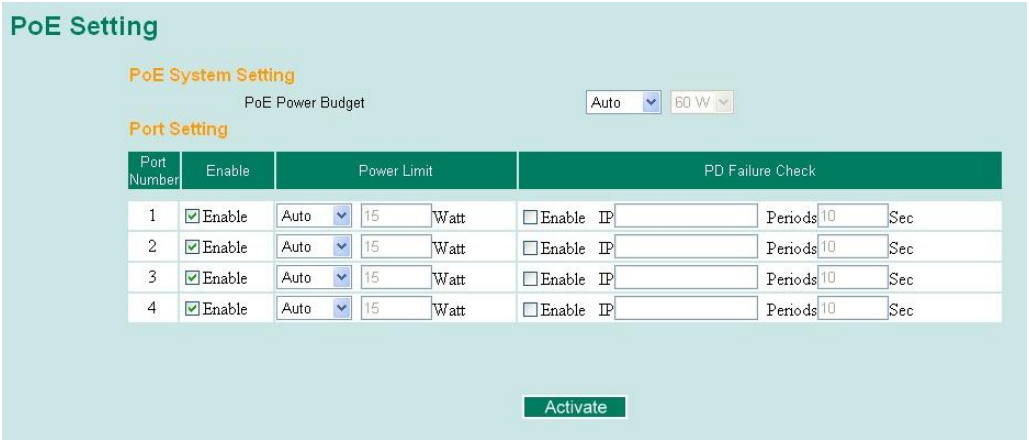
In fact, it's not uncommon for video, voice, and high-rate industrial application data transfers to be integrated into one network. Moxa's IKS-6726-8PoE is equipped with many advanced PoE management functions, providing vital security systems with a convenient and reliable Gigabit Ethernet network.

PoE Setting

The settings are included to give the user control over the system's PoE power budget, PoE port access, PoE port power limit, and PD failure check. The total power output limit is 120 watts.

The IKS-6726-8PoE will detect the usage of each connected PD device automatically and determine the amount of power supplied. The priority is determined by the amount of time the devices are connected, and the order of the port numbers. For example, if slot 1 outputs all 120 watts, then slot 2 cannot output any power.

An explanation of each configuration item is given below:



Port Setting

Enable

Setting	Description	Factory Default
Checked	Allows data and power transmission through the port	Enable
Unchecked	Immediately shuts off port access	Enable

Power Limit

Setting	Description	Factory Default
Auto	The amount of power assigned is determined according to the class that is read from the powered device.	Auto

The IKS-6726-8PoE can monitor PD working status via its IP conditions. If the PD fails, the switch will not receive a PD response after the defined period, and the authentication process is restarted. This is an excellent function to ensure your network reliability and reduce management burden.

PD Failure Check

Setting	Description	Factory Default
Checked	Enables the PD Failure Check function.	Auto
Unchecked	Disables the PD Failure Check function.	Auto

IP

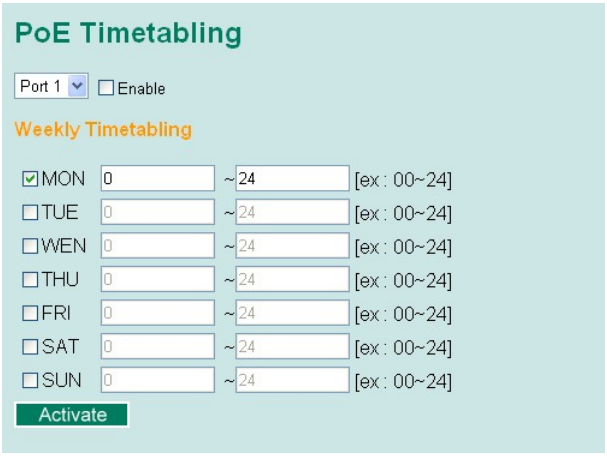
Setting	Description	Factory Default
Max. 15 Characters	Enter the IP for the PD	None

Period

Setting	Description	Factory Default
Max. 5 Characters	Enter the time span for IP checking period	None

PoE Timetabling

Powered devices usually do not need to be running 24 hours a day, 7days a week. The IKS-6726-8PoE provides a PoE timetabling mechanism to let users set a flexible working schedule for each PoE port to economize the system's power burden.



Port

Setting	Description	Factory Default
Port	Enable a dedicated port	None

Enable

Setting	Description	Factory Default
Checked	Enables the port for a defined time period	Disable
Unchecked	Disables the port for a defined time period	Disable

Weekly Timetabling

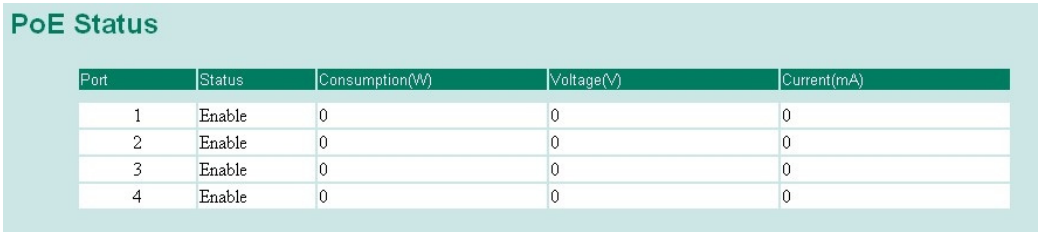
Day

Setting	Description	Factory Default
Checked	Enables the port for a defined number of days	Disable
Unchecked	Disables the port for a defined number of days	Disable

Start/End Time

Setting	Description	Factory Default
Time for working period	Allows users to enter the start and end time for the PD's working period	None

PoE Status



Status

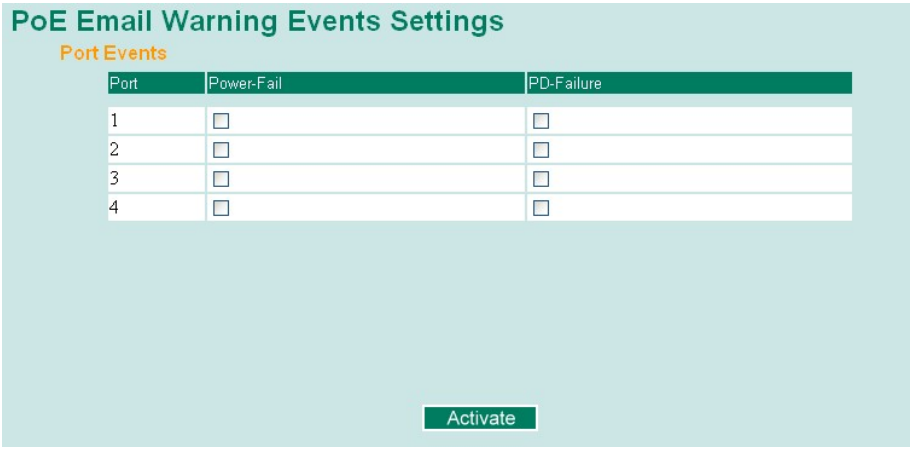
Enable/Disable	Indicates the PoE port status
Consumption (W)	Indicates the actual Power consumed value for PoE port
Voltage (V)	Indicates the actual Voltage consumed value for PoE port
Current (mA)	Indicates the actual Current consumed value for PoE port

PoE Email Warning Events Settings

Since industrial Ethernet devices are often located at the endpoints of a system, these devices do not always know what is happening elsewhere on the network. This means that a PoE port connected to a PD must provide system administrators with real-time alarm messages. Even when control engineers are out of the control room

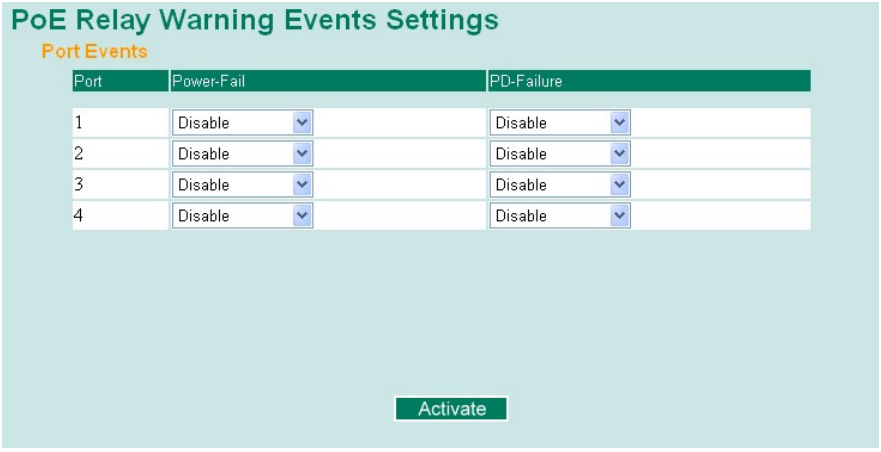
for an extended period of time, they can still be informed of the status of the PD almost instantaneously when exceptions occur. The IKS-6726-8PoE supports different methods for warning engineers automatically, such as email and relay output. It also supports two digital inputs to integrate sensors into your system to automate alarms using email and relay output.

Email Warning Event Types can be divided into two basic groups: **Power-Fail** and **PD-Failure**.



Port Events	Warming e-mail is sent when…
Power-Fail	When actual PD power consumption exceeds related PD power limit setting.
PD-Failure	When the switch cannot receive a PD response after the defined period.

Relay Warning Event Types can be divided into two basic groups: **Power-Fail** and **PD-Failure**.



Port Events	Warming e-mail is sent when…
Power-Fail	When actual PD power consumption exceeds related PD power limit settings.
PD-Failure	When the switch cannot receive a PD response after the defined period.

Using Port Trunking

Link aggregation involves grouping links to into a link aggregation group. A MAC client can treat link aggregation groups as if they were a single link.

The IKS-6726-8PoE's port trunking feature allows devices to communicate by aggregating up to 3 trunk groups, with a maximum of 8 ports for each group. If one of the 8 ports fails, the other seven ports will automatically provide backup and share the traffic.

Port trunking can be used to combine up to 8 ports between two IKS-6726-8PoE switches. If all ports on both switch units are configured as 100BaseTX and they are operating in full duplex, the potential bandwidth of the connection will be 1600 Mbps.

The Port Trunking Concept

Moxa has developed a proprietary port trunking protocol that provides the following benefits:

- More flexibility in setting up your network connections, since the bandwidth of a link can be doubled, tripled, or quadrupled.
- Redundancy—if one link is broken, the remaining trunked ports share the traffic within this trunk group.
- Load sharing—MAC client traffic may be distributed across multiple links.

To avoid broadcast storms or loops in your network while configuring a trunk, first disable or disconnect all ports that you want to add to the trunk or remove from the trunk. After you finish configuring the trunk, enable or re-connect the ports.

If all ports on both switch units are configured as 100BaseTX and they are operating in full duplex mode, the potential bandwidth of the connection will be up to 1.6 Gbps. This means that users can double, triple, or quadruple the bandwidth of the connection by port trunking between two PT series switches.

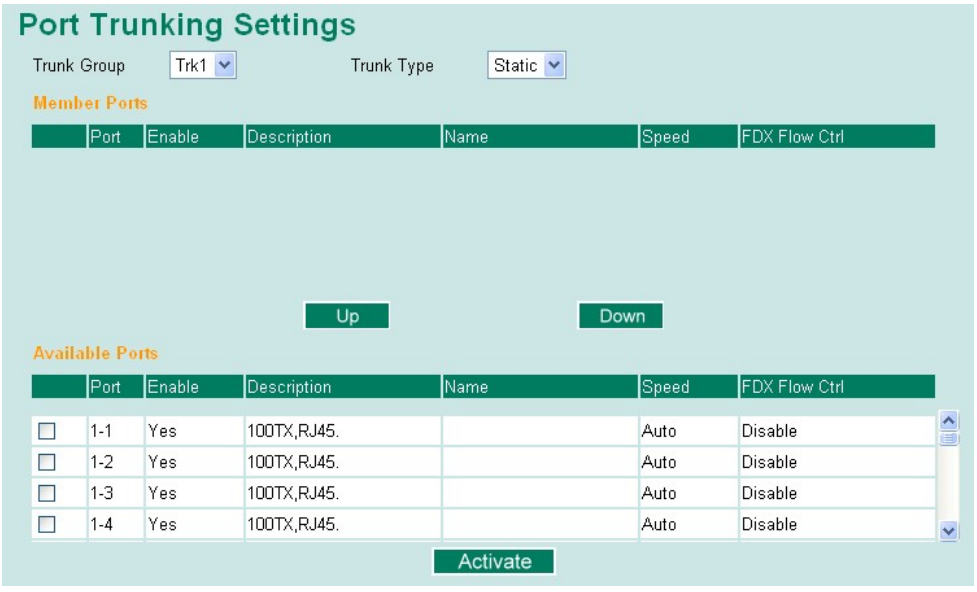
Each IKS-6726-8PoE can set a maximum of 3 port trunking groups. When you activate port trunking, certain settings on each port will be reset to factory default values or disabled:

- Communication redundancy will be reset
- 802.1Q VLAN will be reset
- Multicast Filtering will be reset
- Port Lock will be reset and disabled.
- Set Device IP will be reset
- Mirror will be reset

After port trunking has been activated, you may configure these items again for each trunking ports.

Configuring Port Trunking

The **Port Trunking Settings** page is where ports are assigned to a trunk group.



Step 1: Select the desired **Trunk Group** (Trk1, Trk2, Trk3).

Step 2: Select the **Trunk Type** (Static or LACP).

Step 3: Select the desired ports under **Available Ports** and click **Up** to add to the Trunk Group.

Step 4: Select the desired ports under **Member Ports** and click **Down** to remove from the group.

Trunk Group (Maximum of 3 trunk groups)

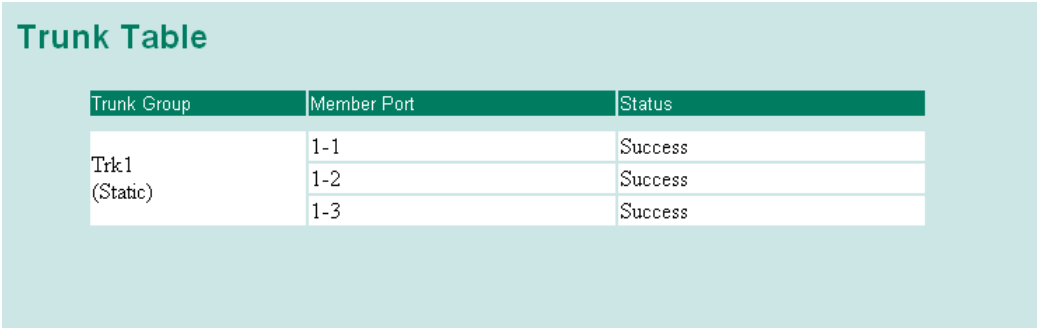
Setting	Description	Factory Default
Trk1, Trk2, Trk3	This specifies the current trunk group.	Trk1

Trunk Type

Setting	Description	Factory Default
Static	This selects Moxa's proprietary trunking protocol.	Static
LACP	This selects LACP (IEEE 802.3ad, Link Aggregation Control Protocol).	Static

Available Ports/Member Ports

Setting	Description	Factory Default
Member/available ports	This lists the ports in the current trunk group and the ports that are available to be added.	N/A
Check box	This selects the port to be added or removed from the group.	Unchecked
Port	This is how each port is identified.	N/A
Port description	This displays the media type for each port.	N/A
Name	This displays the specified name for each port.	N/A
Speed	This indicates the transmission speed for each port (100M-Full, 100M-Half, 10M-Full, or 10M-Half).	N/A
FDX flow control	This indicates if the FDX flow control of this port is enabled or disabled.	N/A
Up	This is used to add selected ports into the trunk group from available ports.	N/A
Down	This is used to remove selected ports from the trunk group.	N/A



Trunk Table

Setting	Description
Trunk group	Displays the trunk type and trunk group.
Member port	Displays the member ports that belong to the trunk group.
Status	Success means port trunking is working properly. Fail means port trunking is not working properly. Standby means port trunking is working as a standby port. When there are more than eight ports trunked as a trunking group, the 9th port will be the standby port.

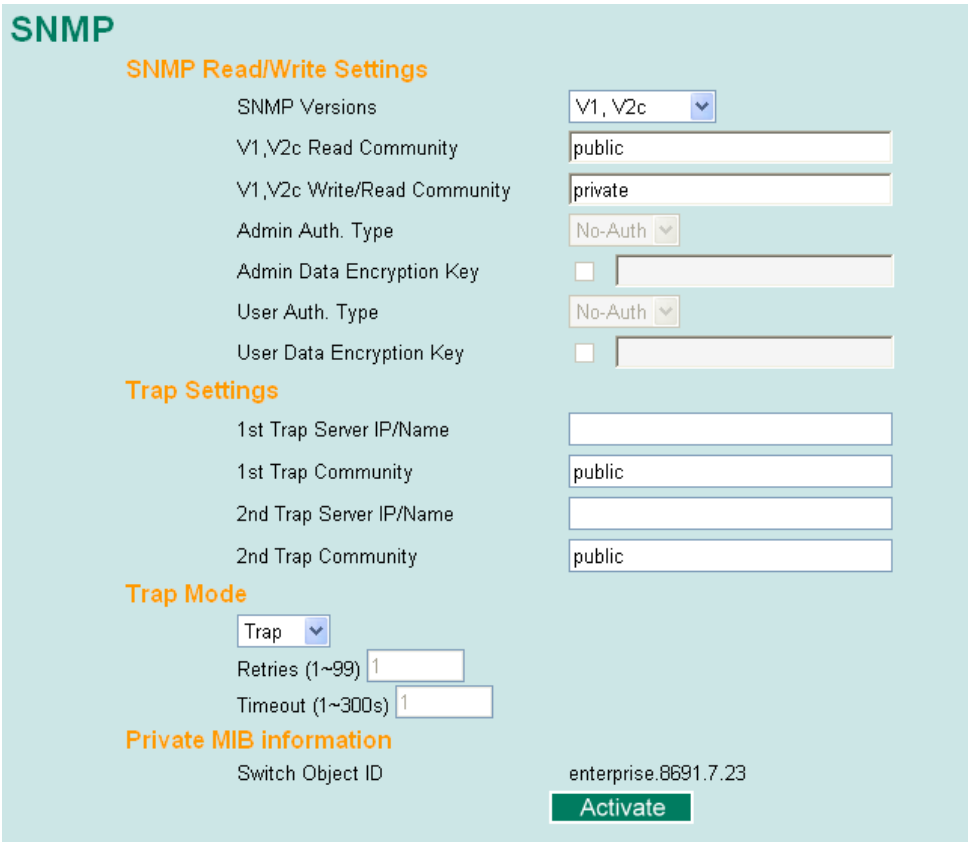
Configuring SNMP

The IKS-6726-8PoE supports SNMP V1, V2c, and V3. SNMP V1 and SNMP V2c use a community string match for authentication, which means that SNMP servers access all objects with read-only or read/write permissions using the community strings *public* and *private* by default. SNMP V3 requires that you select an authentication level of MD5 or SHA, and is the most secure protocol. You can also enable data encryption to enhance data security.

Supported SNMP security modes and levels are shown in the following table. Select the security mode and level that will be used to communicate between the SNMP agent and manager.

Protocol Version	UI Setting	Authentication	Encryption	Method
SNMP V1, V2c	V1, V2c Read Community	Community string	No	This uses a community string match for authentication.
	V1, V2c Write/Read Community	Community string	No	This uses a community string match for authentication.
SNMP V3	No-Auth	No	No	This uses an account with admin or user to access objects
	MD5 or SHA	Authentication based on MD5 or SHA	No	This provides authentication based on HMAC-MD5, or HMAC-SHA algorithms. 8-character passwords are the minimum requirement for authentication.
	MD5 or SHA	Authentication based on MD5 or SHA	Data encryption key	This provides authentication based on HMAC-MD5 or HMAC-SHA algorithms, and data encryption key. 8-character passwords and a data encryption key are the minimum requirements for authentication .and encryption.

These parameters are configured on the SNMP page. A more detailed explanation of each parameter is given below the figure.



SNMP Read/Write Settings

SNMP Versions

Setting	Description	Factory Default
V1, V2c, V3, or V1, V2c, or V3 only	This specifies the SNMP protocol version used to manage the switch.	V1, V2c

V1, V2c Read Community

Setting	Description	Factory Default
Max. 30 characters	This specifies the community string to authenticate the SNMP agent for read-only access. The SNMP agent will access all objects with read-only permissions using this community string.	Public

V1, V2c Write/Read Community

Setting	Description	Factory Default
Max. 30 characters	This specifies the community string to authenticate the SNMP agent for read/write access. The SNMP server will access all objects with read/write permissions using this community string.	Private

For SNMP V3, there are two levels of privilege for different accounts to access the IKS-6726-8PoE. **Admin** privilege provides access and authorization to read and write the MIB file. **User** privilege allows reading of the MIB file only.

Admin Auth. Type (for SNMP V1, V2c, V3, and V3 only)

Setting	Description	Factory Default
No-Auth	This allows the admin account to access objects without authentication.	No
MD5-Auth	Authentication will be based on the HMAC-MD5 algorithms. 8-character passwords are the minimum requirement for authentication.	No
SHA-Auth	Authentication will be based on the HMAC-SHA algorithms. 8-character passwords are the minimum requirement for authentication.	No

Admin Data Encryption Key (for SNMP V1, V2c, V3, and V3 only)

Setting	Description	Factory Default
Enable	This enables data encryption using the specified data encryption key (between 8 and 30 characters).	No
Disable	This specifies that data will not be encrypted.	No

User Auth. Type (for SNMP V1, V2c, V3 and V3 only)

Setting	Description	Factory Default
No-Auth	This allows the admin account and user account to access objects without authentication.	No
MD5-Auth	Authentication will be based on the HMAC-MD5 algorithms. 8-character passwords are the minimum requirement for authentication.	No
SHA-Auth	Authentication will be based on the HMAC-SHA algorithms. 8-character passwords are the minimum requirement for authentication.	No

User Data Encryption Key (for SNMP V1, V2c, V3 and V3 only)

Setting	Description	Factory Default
Enable	This enables data encryption using the specified data encryption key (between 8 and 30 characters).	No
Disable	No data encryption	No

Trap Settings

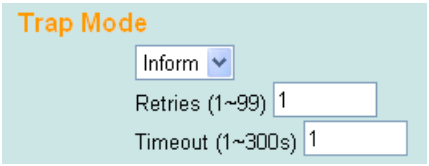
SNMP traps allow an SNMP agent to notify the NMS of a significant event. The switch supports two SNMP modes, **Trap** mode and **Inform** mode.

SNMP Trap Mode

In Trap mode, the SNMP agent sends an SNMPv1 trap PDU to the NMS. No acknowledgment is sent back from the NMS so the agent has no way of knowing if the trap reached the NMS.

SNMP Inform Mode

SNMPv2 provides an inform mechanism. When an inform message is sent from the SNMP agent to the NMS, the receiver sends a response to the sender acknowledging receipt of the event. This behavior is similar to that of the get and set requests. If the SNMP agent doesn't receive a response from the NMS for a period of time, the agent will resend the trap to the NMS agent. The maximum timeout time is 300 sec (default is 1 sec), and the maximum number of retries is 99 times (default is 1 time). When the SNMP agent receives acknowledgement from the NMS, it will stop resending the inform messages.



1st Trap Server IP/Name

Setting	Description	Factory Default
IP or name	This specifies the IP address or name of the primary trap server used by your network.	None

1st Trap Community

Setting	Description	Factory Default
Max. 30 characters	This specifies the community string to use for authentication.	Public

2nd Trap Server IP/Name

Setting	Description	Factory Default
IP or name	This specifies the IP address or name of the secondary trap server used by your network.	None

2nd Trap Community

Setting	Description	Factory Default
Max. 30 characters	This specifies the community string to use for authentication.	Public

Private MIB information

Switch Object ID

Setting	Description	Factory Default
8691.7.23	This indicates the IKS-6726-8PoE's enterprise value.	Fixed

NOTE: *The Switch Object ID cannot be changed.*

Using Communication Redundancy

Communication redundancy on your network helps protect critical links against failure, protects against network loops, and keeps network downtime at a minimum.

Communication redundancy functions allow the user to set up *redundant loops* in the network to provide a backup data transmission route in the event that a cable is inadvertently disconnected or damaged. This is a particularly important feature for industrial applications, since it could take several minutes to locate the disconnected or severed cable. For example, if the IKS-6726-8PoE is used as a key communications component of a production line, several minutes of downtime can result in a big loss in production and revenue. The IKS-6726-8PoE supports three different protocols for communication redundancy—**Rapid Spanning Tree Protocol (IEEE-802.1w)** and **Turbo Ring**, and **Turbo Ring V2**.

When configuring a redundant ring, all switches on the same ring must be configured using the same redundancy protocol. You cannot mix the Turbo Ring, Turbo Ring V2, and STP/RSTP protocols within a ring. The following table lists the key differences between each feature. Use this information to evaluate each the benefits of each, and then determine which features are most suitable for your network.

	Turbo Ring V2	Turbo Ring	STP	RSTP
Topology	Ring	Ring	Ring, Mesh	Ring, Mesh
Recovery Time	< 20 ms	< 300 ms	Up to 30 sec.	Up to 5 sec

NOTE Most managed switches by Moxa support two proprietary Turbo Ring protocols:

- Turbo Ring refers to the original version of Moxa's proprietary redundant ring protocol, which has a recovery time of under 300 ms.
- Turbo Ring V2 refers to the new generation Turbo Ring, which has a recovery time of under 20 ms.

The Turbo Ring Concept

Moxa developed the proprietary Turbo Ring protocol to optimize communication redundancy and achieve a faster recovery time on the network.

The Turbo Ring and Turbo Ring V2 protocols designate one switch as the ***master*** of the network, and then automatically block packets from traveling through any of the network's redundant loops. In the event that one branch of the ring gets disconnected from the rest of the network, the protocol automatically readjusts the ring so that the part of the network that was disconnected can reestablish contact with the rest of the network.

Initial setup for Turbo Ring or Turbo Ring V2	
	For each switch in the ring, select any two ports as the redundant ports. Connect redundant ports on neighboring switches to form the redundant ring.

The user does not need to manually assign the master with Turbo Ring or Turbo Ring V2. If no switch is assigned as the master, the protocol automatically selects one of the switches to be the master. The master is only used to identify which segment in the redundant ring acts as the backup path. In the following subsections, we explain how the redundant path is selected for rings configured for Turbo Ring and Turbo Ring V2.

Determining the Redundant Path for Turbo Ring

In this case, the redundant segment (i.e., the segment that will be blocked during normal operation) is determined by the number of IKS series Ethernet switches in the ring and by the location of the master switch.

Turbo Ring with an even number of switches	
	If the number of Ethernet switches in the Turbo Ring is 2N (an even number), the backup segment is one of the two segments connected to the (N+1) st switch (i.e., the unit directly opposite the master).

Turbo Ring with an odd number switches	
	If the number of Ethernet switches in the Turbo Ring is 2N+1 (an odd number), the backup segment is the (N+1)st segment counting counterclockwise. For the example shown here, N=1, so that N+1=2.

Determining the Redundant Path for Turbo Ring V2	
	For Turbo Ring V2, the backup segment is the segment connected to the 2nd redundant port on the master. Please refer to Configuring Turbo Ring V2 later in this chapter.

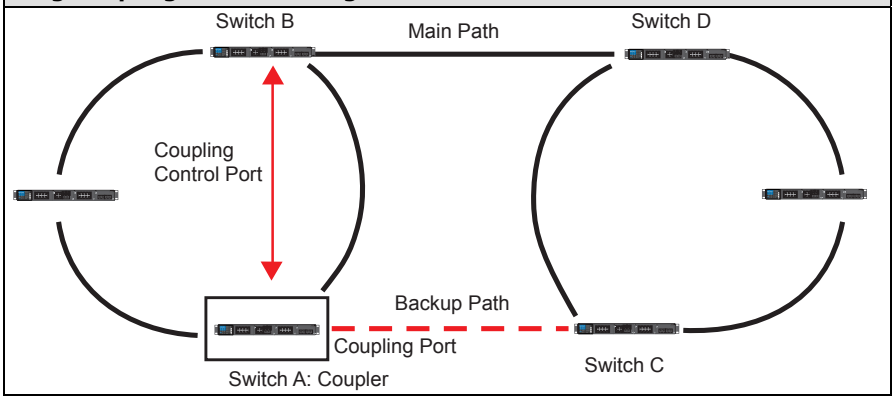
Ring Coupling Configuration

For some systems, it may not be convenient to connect all devices in the system in a single redundant ring, since some devices could be located in a remote area. For these systems, **Ring Coupling** can be used to group devices into smaller redundant rings that communicate with each other.

ATTENTION

In a VLAN environment, the user must set **Redundant Port Coupling Port** and **Coupling Control Port** to join all VLANs, since these ports act as the **backbone** to transmit all packets of different VLANs to the different IKS series Ethernet switches.

Ring Coupling for Turbo Ring

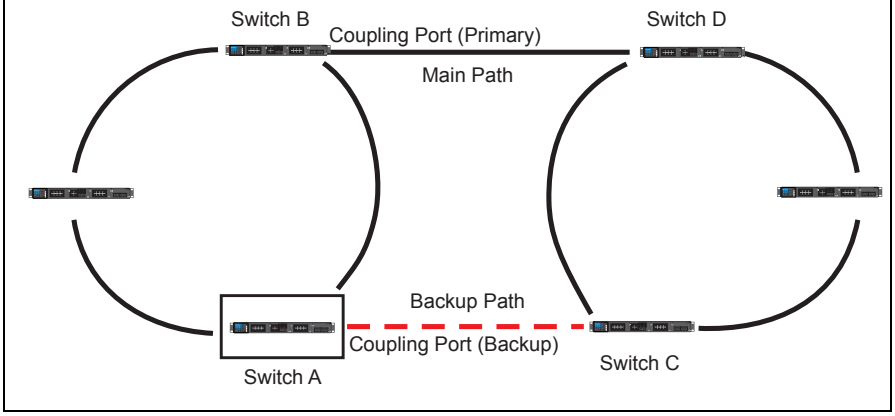


To configure the ring coupling for a **Turbo Ring**, select two IKS series Ethernet switches (e.g., Switch A and B in the above figure) in the ring, and another two IKS series Ethernet switches in the adjacent ring (e.g., Switch C and D).

Select two ports on each switch to be used as coupling ports and link them together. Next, assign one switch (e.g., Switch A) to be the **coupler** and connect the coupler's coupling control port with Switch B (for this example).

The coupler switch (i.e., Switch A) will monitor switch B through the coupling control port to determine whether or not the coupling port's backup path should be recovered.

Ring Coupling for Turbo Ring V2



Note that the ring coupling settings for a **Turbo Ring V2** are different from a **Turbo Ring**. For Turbo Ring V2, ring coupling is enabled by configuring the **Coupling Port (Primary)** on Switch B and the **Coupling Port (Backup)** on Switch A only. You do not need to set up a coupling control port, so **Turbo Ring V2** does not require a coupling control line.

The **Coupling Port (Backup)** on Switch A is used for the backup path and connects directly to a network port on Switch C. The **Coupling Port (Primary)** on Switch B monitors the status of the main path, and connects directly to an extra network port on Switch D. With ring coupling established, Switch A can activate the backup path as soon as it detects a problem with the main path.

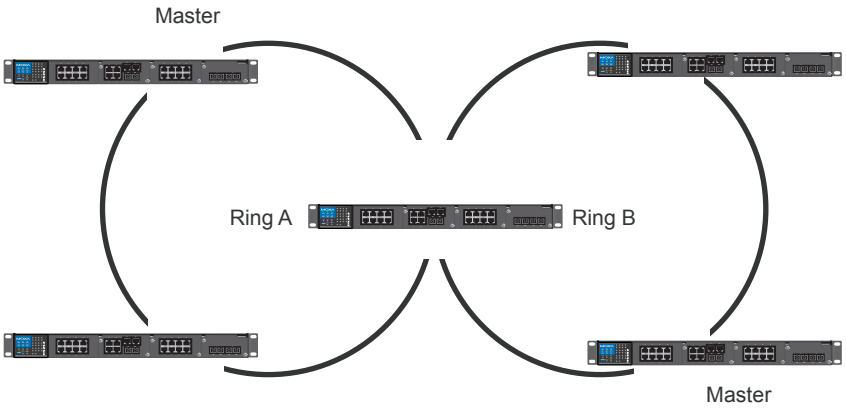
ATTENTION

Ring coupling only needs to be enabled on one of the switches serving as the ring coupler. The coupler must assign separate ports for the two Turbo Ring ports and the coupling port.

NOTE You do not need to use the same IKS series Ethernet switch for both ring coupling and ring master.

Dual-Ring Configuration (applies only to "Turbo Ring V2")

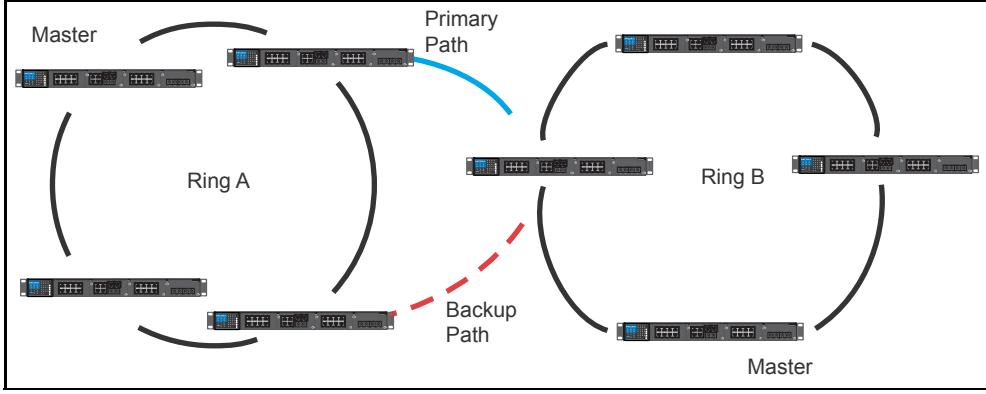
The "dual-ring" option, in which two adjacent rings share one switch, provides another ring coupling configuration. This type of configuration is ideal for applications that have inherent cabling difficulties.



Dual-Homing Configuration for Turbo Ring V2

Dual-homing is only supported with Turbo Ring V2 and is used to connect two networks through a single Ethernet switch. The primary path is the operating connection, and the backup path is a back-up connection that is activated in the event that the primary path connection fails.

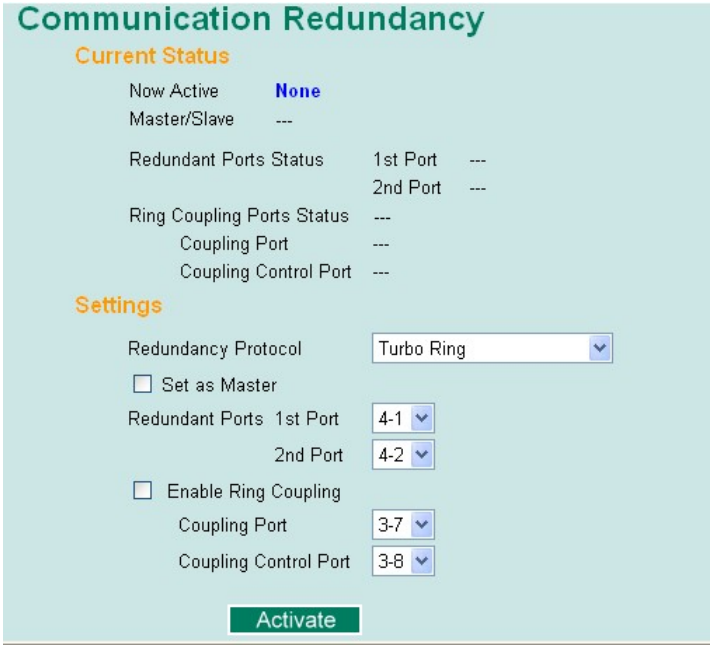
Dual-Homing for Turbo Ring V2



Configuring Turbo Ring and Turbo Ring V2

On the **Communication Redundancy** page, select **Turbo Ring, Turbo Ring V2** or **Turbo Chain** as the **Redundancy Protocol**. Note that each protocol's configuration page is different.

Configuring Turbo Ring



Current Status

Now Active

This shows which communication protocol is in use: **Turbo Ring, Turbo Ring V2, Turbo Chain, RSTP**, or **none**.

Master/Slave

This indicates whether or not the IKS-6726-8PoE is the master of the Turbo Ring. This field appears only for Turbo Ring or Turbo Ring V2.

NOTE The user does not need to assign the master to use Turbo Ring or Turbo Ring V2. If no master is assigned, the Turbo Ring protocol will automatically assign master status to one of the IKS series Ethernet switches in the ring. The master is only used to determine which segment serves as the backup path.

Redundant Ports Status (1st Port, 2nd Port)
Ring Coupling Ports Status (Coupling Port, Coupling Control Port)

The **Ports Status** indicators show ***Forwarding*** for normal transmission, ***Blocking*** if the port is part of a backup path that is currently blocked, and ***Link down*** if there is no connection.

Settings

Redundancy Protocol

Setting	Description	Factory Default
Turbo Ring	Select this item to change to the Turbo Ring configuration page.	None
Turbo Ring V2	Select this item to change to the Turbo Ring V2 configuration page.	
Turbo Chain	Select this item to change to the Turbo Chain configuration page	
RSTP (IEEE 802.1W/1D)	Select this item to change to the RSTP configuration page.	
None	Ring redundancy is not active	

Set as Master

Setting	Description	Factory Default
Yes	The IKS-6726-8PoE is manually selected as the master.	No
No	The Turbo Ring or Turbo Ring V2 protocol will automatically select the master.	

Redundant Ports

Setting	Description	Factory Default
1st Port	This specifies which port on the IKS-6726-8PoE will be used as the first redundant port.	Port 1-1 (without Gigabit Ethernet module) Port 4-1 (with Gigabit Ethernet module)
2nd Port	This specifies which port on the IKS-6726-8PoE will be used as the second redundant port.	Port 1-2 (without Gigabit Ethernet module) Port 4-2 (with Gigabit Ethernet module)

Enable Ring Coupling

Setting	Description	Factory Default
Enable	This specifies that this IKS-6726-8PoE will be a ring coupler.	Disable
Disable	This specifies that this IKS-6726-8PoE is not a ring coupler.	

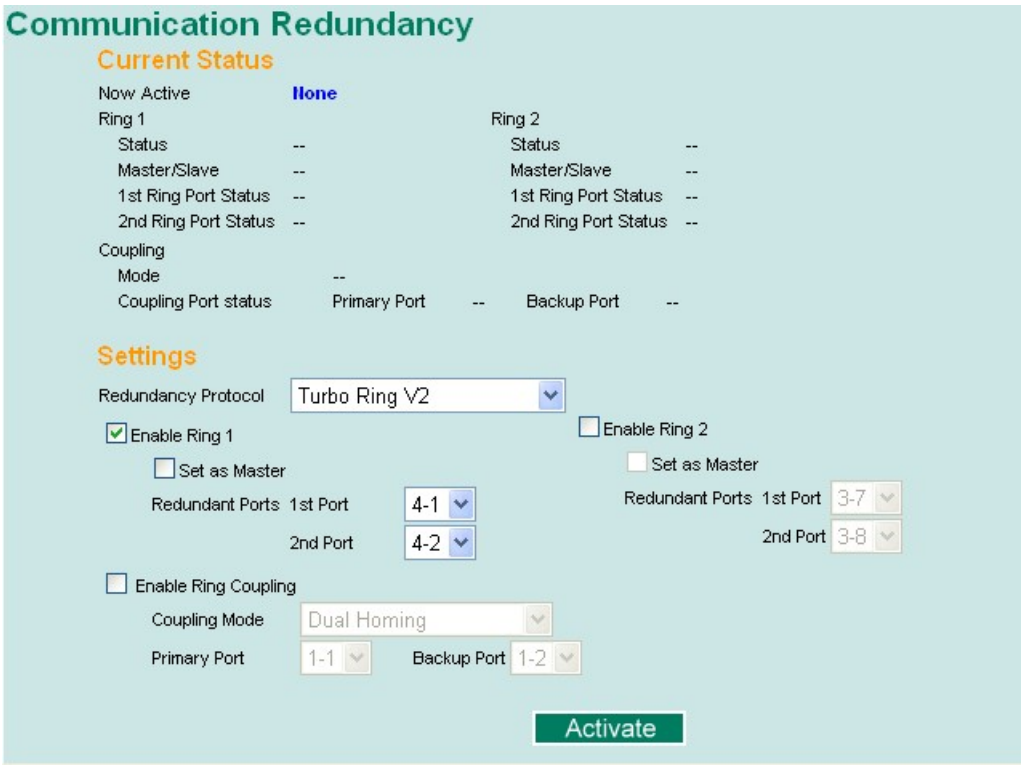
Coupling Port

Setting	Description	Factory Default
Coupling Port	This specifies which port on the IKS-6726-8PoE will be used as the coupling port.	Port 1-3 (without Gigabit Ethernet module) Port 1-1 (with Gigabit Ethernet module)

Coupling Control Port

Setting	Description	Factory Default
Coupling Control Port	This specifies which port on the IKS-6726-8PoE will be used as the coupling control port.	Port 1-4 (without Gigabit Ethernet module) Port 1-2 (with Gigabit Ethernet module)

Configuring Turbo Ring V2



NOTE When using a dual-ring architecture, users must complete configuration for both Ring 1 and Ring 2. The status of both rings will appear under Current Status.

Current Status

Now Active

This shows which communication protocol is in use: **Turbo Ring, Turbo Ring V2, Turbo Chain, RSTP**, or **none**.

Ring 1/2—Status

This shows **Healthy** if the ring is operating normally, and shows **Break** if the ring's backup link is active.

Ring 1/2—Master/Slave

This indicates whether or not the IKS-6726-8PoE is the master of the Turbo Ring. This field appears only when selected to operate in Turbo Ring or Turbo Ring V2 mode.

NOTE The user does not need to assign the master to use Turbo Ring or Turbo Ring V2. If no master is assigned, the Turbo Ring protocol will automatically assign master status to one of the IKS series Ethernet switches in the ring. The master is only used to determine which segment serves as the backup path.

Ring 1/2—1st Ring Port Status
Ring 1/2—2nd Ring Port Status

The **Ports Status** indicators show ***Forwarding*** for normal transmission, ***Blocking*** if this port is connected to a backup path and the path is blocked, and ***Link down*** if there is no connection.

Coupling—Mode

This indicates either **None**, **Dual Homing**, or **Ring Coupling**.

Coupling—Coupling Port status

This indicates either **Primary**, or **Backup**.

Settings

Redundancy Protocol

Setting	Description	Factory Default
Turbo Ring	Select this item to change to the Turbo Ring configuration page.	None
Turbo Ring V2	Select this item to change to the Turbo Ring V2 configuration page.	
Turbo Chain	Select this item to change to the Turbo Chain configuration page	
RSTP (IEEE 802.1W/1D)	Select this item to change to the RSTP configuration page.	
None	Ring redundancy is not active	

Enable Ring 1

Setting	Description	Factory Default
Enable	This enables Ring 1.	Enable
Disable	This disables Ring 1.	

Enable Ring 2*

Setting	Description	Factory Default
Enable	This enables Ring 2.	Disable
Disable	This disables Ring 2.	

*Both Ring 1 and Ring 2 must be enabled when using the dual-ring architecture.

Set as Master

Setting	Description	Factory Default
Yes	The IKS-6726-8PoE is manually selected as the master.	No
No	The Turbo Ring or Turbo Ring V2 protocol will automatically select the master.	

1st Ring Port, 2nd Ring Port

Setting	Description	Factory Default
1st Port	This specifies which port on the IKS-6726-8PoE will be used as the first redundant port.	Ring 1: Port 1-1 (without Gigabit Ethernet module) Port 4-1 (with Gigabit Ethernet module) Ring 2: Port 1-3 (without Gigabit Ethernet module) Port 1-1 (with Gigabit Ethernet module)
2nd Port	This specifies which port on the IKS-6726-8PoE will be used as the second redundant port.	Ring 1: Port 1-2 (without Gigabit Ethernet module) Port 4-2 (with Gigabit Ethernet module) Ring 2: Port 1-4 (without Gigabit Ethernet module) Port 1-2 (with Gigabit Ethernet module)

Enable Ring Coupling

Setting	Description	Factory Default
Enable	This specifies that this IKS-6726-8PoE will be a ring coupler.	Disable
Disable	This specifies that this IKS-6726-8PoE is not a ring coupler.	

Coupling Mode

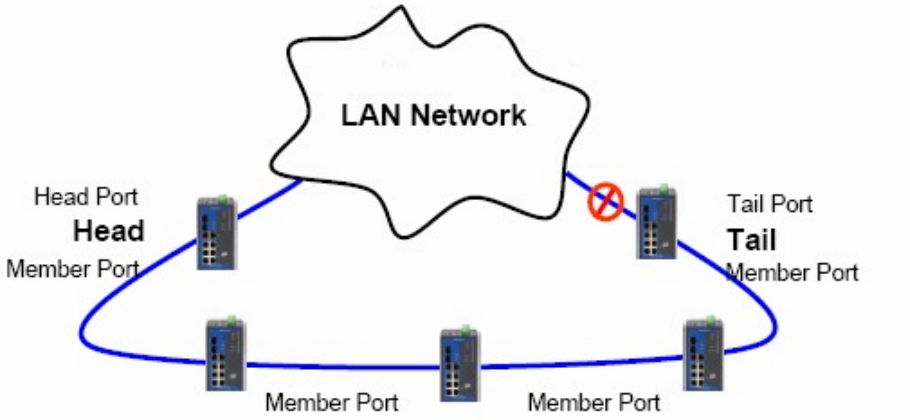
Setting	Description	Factory Default
Dual Homing	This enables dual homing through the IKS-6726-8PoE.	Primary Port: Port 1-5 (without Gigabit Ethernet module) Port 1-3 (with Gigabit Ethernet module) Backup Port: Port 1-6 (without Gigabit Ethernet module) Port 1-4 (with Gigabit Ethernet module)
Ring Coupling (backup)	This specifies that the IKS-6726-8PoE will be used for a ring coupling backup connection.	Coupling Port: Port 1-5 (without Gigabit Ethernet module) Port 1-3 (with Gigabit Ethernet module)
Ring Coupling (primary)	This specifies that the IKS-6726-8PoE will be used for a ring coupling primary connection.	Coupling Port: Port 1-5 (without Gigabit Ethernet module) Port 1-3 (with Gigabit Ethernet module)

The Turbo Chain Concept

Moxa's Turbo Chain is an advanced software-technology that gives network administrators the flexibility of constructing any type of redundant network topology. When using the "chain" concept, you first connect the Ethernet switches in a chain and then simply link the two ends of the chain to an Ethernet network, as illustrated in the following figure.

Turbo Chain can be used on industrial networks that have a complex topology. If the industrial network uses a multi-ring architecture, Turbo Chain can be used to create flexible and scalable topologies with a fast media-recovery time.

Setting up Turbo Chain

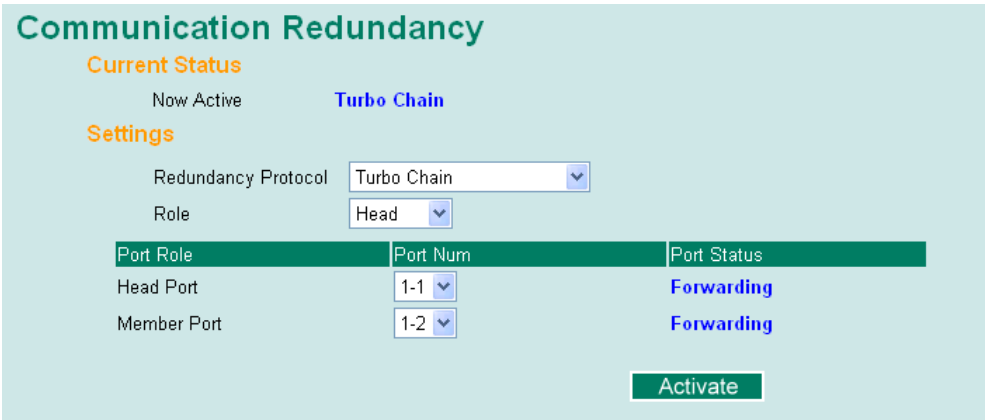


1. Select the Head switch, Tail switch, and Member switches.
2. Configure one port as the Head port and one port as the Member port in the Head switch, configure one port as the Tail port and one port as the Member port in the Tail switch, and configure two ports as Member ports in each of the Member switches.
3. Connect the Head switch, Tail switch, and Member switches as shown in the diagram.

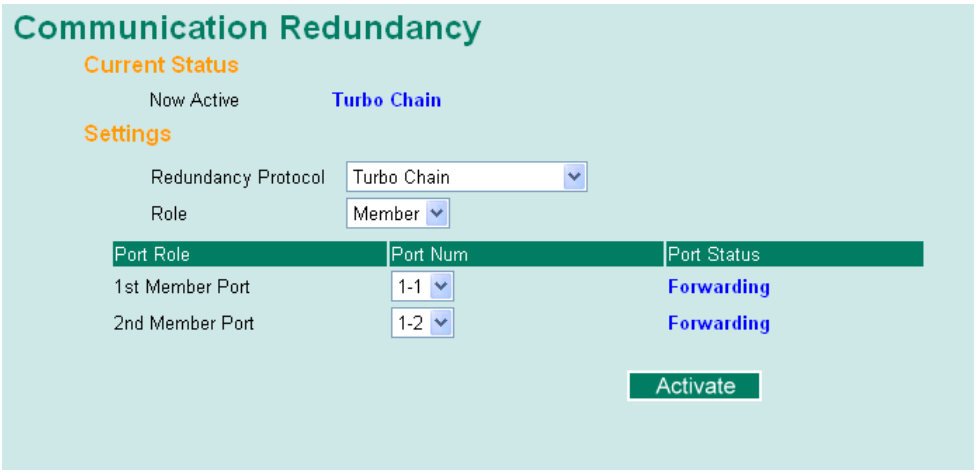
The path connecting to the Head port is the main path, and the path connecting to the Tail port is the back up path of the Turbo Chain. Under normal conditions, packets are transmitted through the Head Port to the LAN Network. If any Turbo Chain path is disconnected, the Tail Port will be activated to continue packet transmission.

Configuring "Turbo Chain"

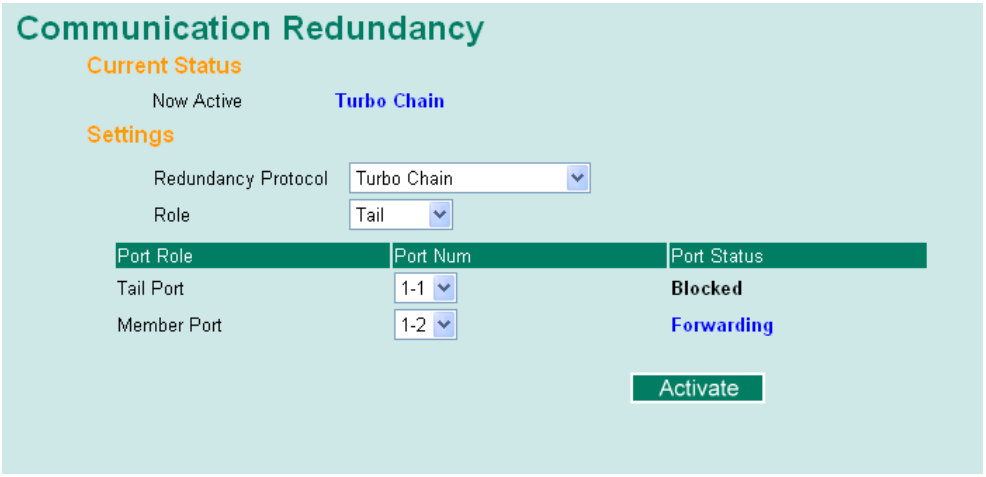
Head Switch Configuration



Member Switch Configuration



Tail Switch Configuration



Current Status

Now Active

Shows which communication protocol is in use: **Turbo Ring**, **Turbo Ring V2**, **RSTP**, **Turbo Chain**, or **None**.

The "Ports Status" indicators show ***Forwarding*** for normal transmission, ***Blocked*** if this port is connected to the Tail port as a backup path and the path is blocked, and ***Link down*** if there is no connection.

Settings

Redundancy Protocol

Setting	Description	Factory Default
Turbo Ring	Select this item to change to the Turbo Ring configuration page.	None
Turbo Ring V2	Select this item to change to the Turbo Ring V2 configuration page.	
Turbo Chain	Select this item to change to the Turbo Chain configuration page	
RSTP (IEEE 802.1W/1D)	Select this item to change to the RSTP configuration page.	
None	Ring redundancy is not active	

Role

Setting	Description	Factory Default
Head	Select as Head Switch	Member
Member	Select as Member Switch	
Tail	Select as Tail Switch	

Head Role

Setting	Description	Factory Default
Head Port	Select any port to be the head port.	Port 1-1 (without Gigabit Ethernet module) Port 4-1 (with Gigabit Ethernet module)
Member Port	Select any port to be the member port.	Port 1-2 (without Gigabit Ethernet module) Port 4-2 (with Gigabit Ethernet module)

Member Role

Setting	Description	Factory Default
1st Member port	Select any port to be the 1st member port	Port 1-1 (without Gigabit Ethernet module) Port 4-1 (with Gigabit Ethernet module)
2nd Member port	Select any port to be the 2nd member port	Port 1-2 (without Gigabit Ethernet module) Port 4-2 (with Gigabit Ethernet module)

Tail Role

Setting	Description	Factory Default
Tail Port	Select any port to be the tail port.	Port 1-1 (without Gigabit Ethernet module) Port 4-1 (with Gigabit Ethernet module)
Member Port	Select any port to be the member port.	Port 1-2 (without Gigabit Ethernet module) Port 4-2 (with Gigabit Ethernet module)

NOTE There are certain restrictions on which ports can be used as chain ports.
You may use any two of the non-Gigabit ports as the chain ports; however, the two chain ports for a particular switch must be on the same module.

The STP/RSTP Concept

Spanning Tree Protocol (STP) was designed to help reduce link failures in a network and provide protection from loops. Networks that have a complicated architecture are prone to broadcast storms caused by unintended loops in the network. The IKS-6726-8PoE's STP feature is disabled by default. To be completely effective, you must enable RSTP/STP on every IKS-6726-8PoE connected to your network.

Rapid Spanning Tree Protocol (RSTP) implements the Spanning Tree Algorithm and Protocol defined by IEEE Std 802.1w-2001. RSTP provides the following benefits:

- The topology of a bridged network will be determined much more quickly compared to STP.
- RSTP is backward compatible with STP, making it relatively easy to deploy. For example:

It defaults to sending 802.1D style BPDUs if packets with this format are received.

STP (802.1D) and RSTP (802.1w) can operate on different ports of the same IKS-6726-8PoE. This feature is particularly helpful when IKS-6726-8PoE ports connect to older equipment, such as legacy switches.

You get essentially the same functionality with RSTP and STP. To see how the two systems different, please refer to *Differences between RSTP and STP* later in this chapter.

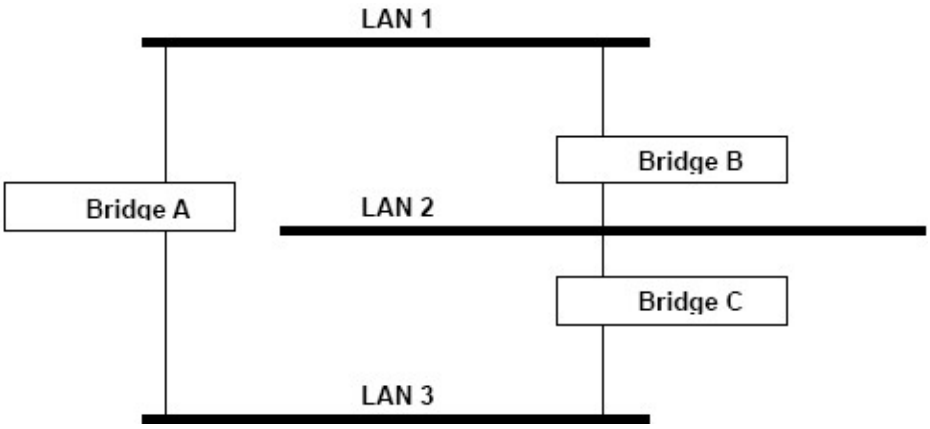
NOTE The STP protocol is part of the IEEE Std 802.1D, 1998 Edition bridge specification. The explanation given below uses bridge instead of switch.

What is STP?

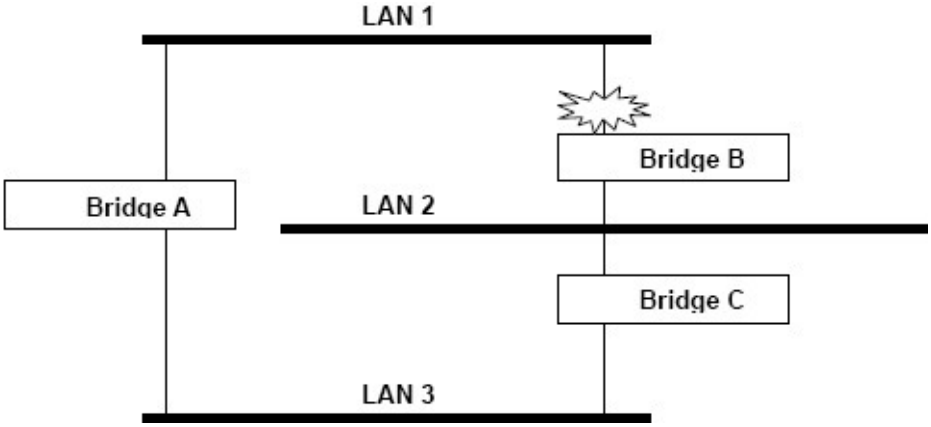
STP (802.1D) is a bridge-based system that is used to implement parallel paths for network traffic. STP uses a loop-detection process to:

- Locate and then disable less efficient paths (i.e., paths that have a lower bandwidth)
- Enable one of the less efficient paths if the most efficient path fails

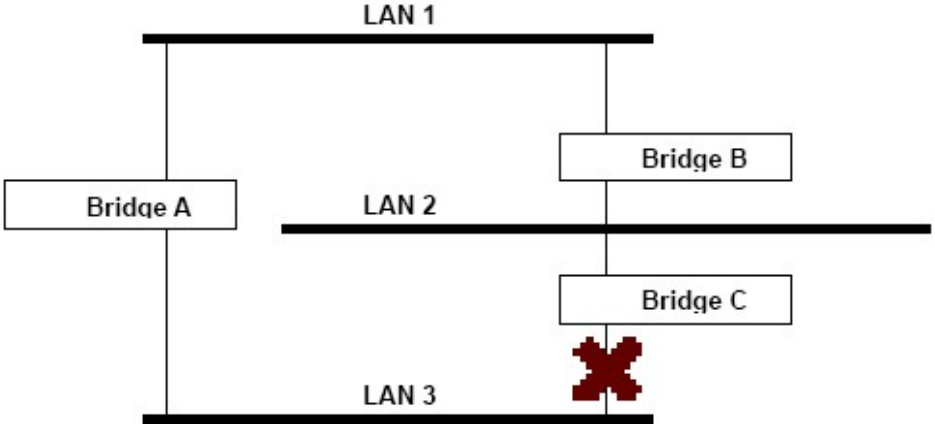
The figure below shows a network made up of three LANs separated by three bridges. Each segment uses at most two paths to communicate with the other segments. Since this configuration can give rise to loops, the network will overload if STP is not enabled.



If STP is enabled, it will detect duplicate paths and prevent, or block, one of them from forwarding traffic. In the following example, STP determined that traffic from LAN segment 2 to LAN segment 1 should flow through Bridges C and A because this path has a greater bandwidth and is therefore more efficient.



What happens if a link failure is detected? As shown in next figure, the STP process reconfigures the network so that traffic from LAN segment 2 flows through Bridge B.



STP will determine which path between each bridged segment is most efficient, and then assign a specific reference point on the network. When the most efficient path has been identified, the other paths are blocked. In the above 3 figures, STP first determined that the path through Bridge C was the most efficient, and as a result, blocked the path through Bridge B. After the failure of Bridge C, STP re-evaluated the situation and opened the path through Bridge B.

How STP Works

When enabled, STP determines the most appropriate path for traffic through a network. The method is described below:

STP Requirements

Before STP can configure the network, the system must satisfy the following requirements:

- Communication must be established between all bridges. This communication is carried out using Bridge Protocol Data Units (BPDUs), which are transmitted in packets with a known multicast address.
- Each bridge must have a Bridge Identifier that specifies which bridge acts as the central reference point, or Root Bridge, for the STP system. Bridges with a lower Bridge Identifier are more likely to be designated as the Root Bridge. The Bridge Identifier is calculated using the MAC address of the bridge and a priority defined for the bridge. The default priority of IKS-6726-8PoE is 32768.

Each port has a cost that specifies the efficiency of each link. The efficiency cost is usually determined by the bandwidth of the link, with less efficient links assigned a higher cost. The following table shows the default port costs for a switch:

Port Speed	Path Cost 802.1D, 1998 Edition	Path Cost 802.1w-2001
10 Mbps	100	2,000,000
100 Mbps	19	200,000
1000 Mbps	4	20,000

STP Calculation

The first step of the STP process is to perform calculations. During this stage, each bridge on the network transmits BPDUs. The following items will then be calculated:

- The bridge that will act as the Root Bridge. The Root Bridge is the central reference point from which the network is configured.
- The Root Path Costs for each bridge. This is the cost of the paths from each bridge to the Root Bridge.
- The identity of each bridge's Root Port. The Root Port is the port on the bridge that connects to the Root Bridge via the most efficient path. In other words, this port connects to the Root Bridge via the path with the lowest Root Path Cost. The Root Bridge itself does not have a Root Port.
- The identity of the Designated Bridge for each LAN segment. The Designated Bridge is the bridge with the lowest Root Path Cost from that segment. If several bridges have the same Root Path Cost, the one with the lowest Bridge Identifier becomes the Designated Bridge. Traffic transmitted in the direction of the Root Bridge will flow through the Designated Bridge. The port on this bridge that connects to the segment is called the Designated Bridge Port.

STP Configuration

After all the bridges on the network agree on the identity of the Root Bridge and all relevant parameters have been established, each bridge is configured to forward traffic only between its Root Port and the Designated Bridge Ports for their respective network segments. All other ports are blocked, which means that they will not be allowed to receive or forward traffic.

STP Reconfiguration

Once the network topology has stabilized, each bridge listens for "Hello" BPDUs that are transmitted from the Root Bridge at regular intervals. If a bridge does not receive a "Hello" BPDU after a certain interval (the Max Age time), the bridge assumes that the Root Bridge, or a link between itself and the Root Bridge, has gone

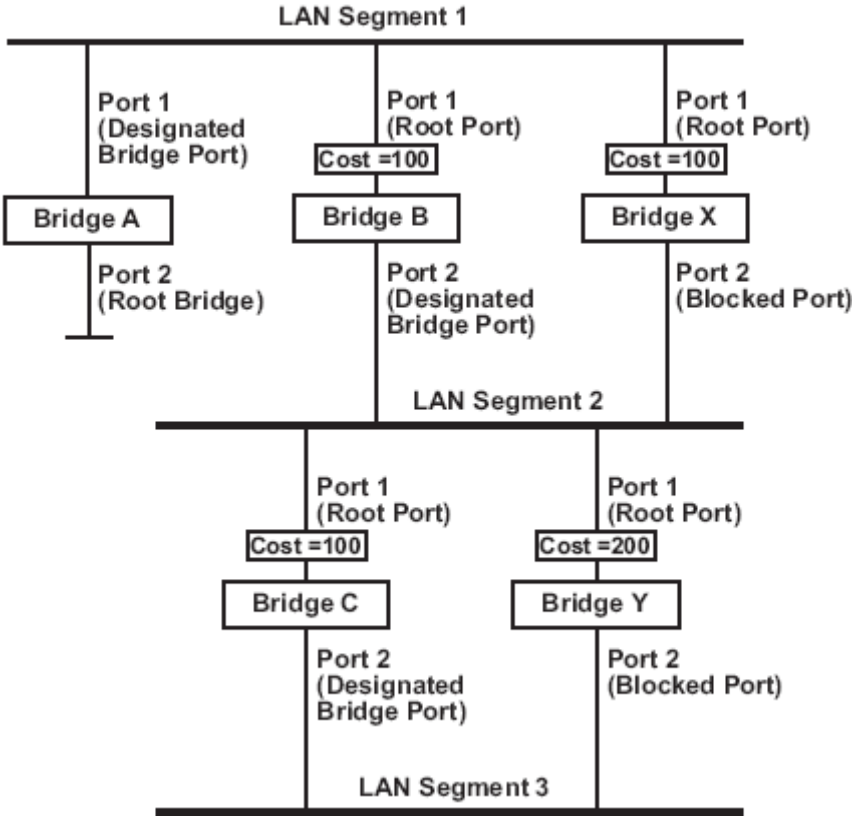
down. This will trigger the bridge to reconfigure the network to account for the change. If you have configured an SNMP trap destination, the first bridge to detect a topology change in your network sends out an SNMP trap.

Differences between RSTP and STP

RSTP is similar to STP, but includes additional information in the BPDUs that allow each bridge to confirm that it has taken action to prevent loops from forming when it decides to enable a link to a neighboring bridge. Adjacent bridges connected via point-to-point links will be able to enable a link without waiting to ensure that all other bridges in the network have had time to react to the change. The main benefit of RSTP is that the configuration decision is made locally rather than network-wide, allowing RSTP can carry out automatic configuration and restore a link faster than STP.

STP Example

The LAN shown below has three segments, with adjacent segments connected using two possible links. The various STP factors, such as Cost, Root Port, Designated Bridge Port, and Blocked Port are shown in the figure.



- Bridge A has been selected as the Root Bridge, since it was determined to have the lowest Bridge Identifier on the network.
- Since Bridge A is the Root Bridge, it is also the Designated Bridge for LAN segment 1. Port 1 on Bridge A is selected as the Designated Bridge Port for LAN Segment 1.
- Ports 1 of Bridges B, C, X, and Y are all Root Ports sine they are nearest to the Root Bridge, and therefore have the most efficient path.
- Bridges B and X offer the same Root Path Cost for LAN segment 2. However, Bridge B was selected as the Designated Bridge for that segment since it has a lower Bridge Identifier. Port 2 on Bridge B is selected as the Designated Bridge Port for LAN Segment 2.
- Bridge C is the Designated Bridge for LAN segment 3, because it has the lowest Root Path Cost for LAN Segment 3:
  - The route through Bridges C and B costs 200 (C to B=100, B to A=100)

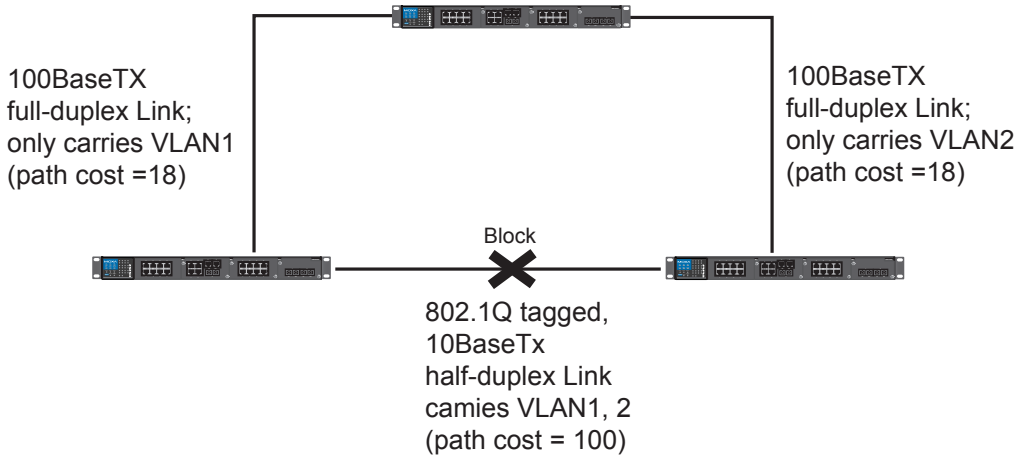
- The route through Bridges Y and B costs 300 (Y to B=200, B to A=100)

- The Designated Bridge Port for LAN Segment 3 is Port 2 on Bridge C.

Using STP on a Network with Multiple VLANs

IEEE Std 802.1D, 1998 Edition, does not take into account VLANs when calculating STP information—the calculations only depend on the physical connections. Consequently, some network configurations will result in VLANs being subdivided into a number of isolated sections by the STP system. You must ensure that every VLAN configuration on your network takes into account the expected STP topology and alternative topologies that may result from link failures.

The following figure shows an example of a network that contains VLANs 1 and 2. The VLANs are connected using the 802.1Q-tagged link between Switch B and Switch C. By default, this link has a port cost of 100 and is automatically blocked because the other Switch-to-Switch connections have a port cost of 36 (18+18). This means that both VLANs are now subdivided—VLAN 1 on Switch units A and B cannot communicate with VLAN 1 on Switch C, and VLAN 2 on Switch units A and C cannot communicate with VLAN 2 on Switch B.

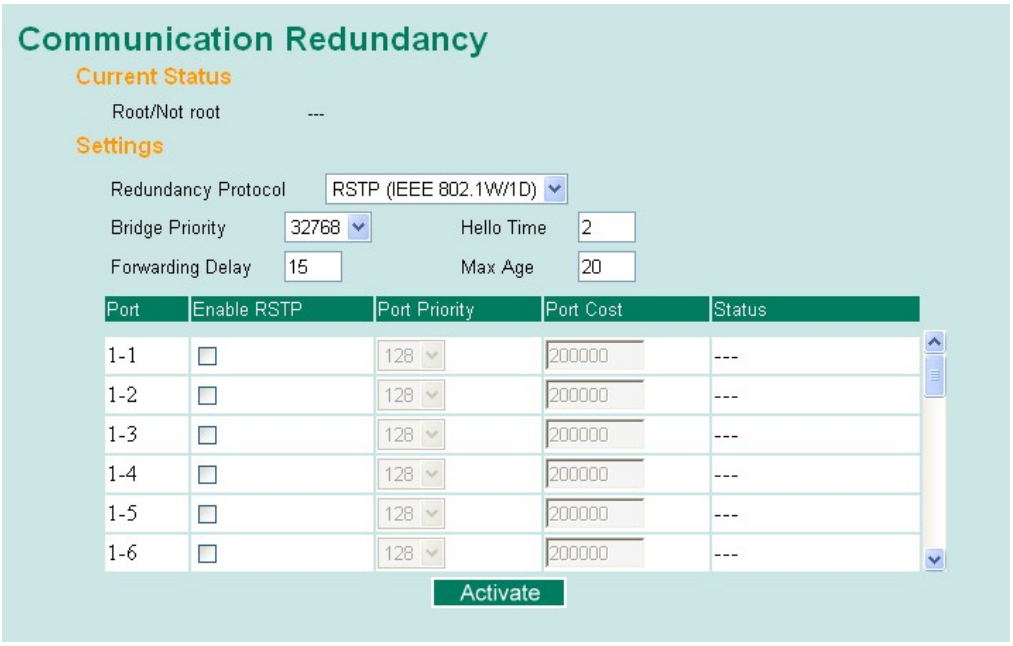


To avoid subdividing VLANs, all inter-switch connections should be made members of all available 802.1Q VLANs. This will ensure connectivity at all times. For example, the connections between Switches A and B, and between Switches A and C should be 802.1Q tagged and carrying VLANs 1 and 2 to ensure connectivity.

See the **Configuring Virtual LANs** section for more information about VLAN Tagging.

Configuring STP/RSTP

The following figures indicate which Spanning Tree Protocol parameters can be configured. A more detailed explanation of each parameter is given below the figure.



At the top of this page, the user can check the **Current Status** of this function. For RSTP, you will see:

Now Active:

This field shows which communication protocol is being used—Turbo Ring, RSTP, or neither.

Root/Not Root

This field appears only for RSTP mode. It indicates whether or not this IKS-6726-8PoE is the Root of the Spanning Tree (the root is determined automatically).

At the bottom of this page, the user can configure the **Settings** for the selected protocol. For RSTP, you can configure:

Protocol of Redundancy

Setting	Description	Factory Default
Turbo Ring	This selects the Turbo Ring protocol.	None
RSTP (IEEE 802.1w/1D)	This selects the RSTP protocol.	None

Bridge Priority

Setting	Description	Factory Default
Numerical value selected by user	This specifies the IKS-6726-8PoE's bridge priority. A lower number means a higher priority, which means a greater chance of being established as the root of the Spanning Tree topology.	32768

Forwarding Delay

Setting	Description	Factory Default
Numerical value input by user	This specifies the amount of time this device will wait before checking to see if it should change to a different state.	15 (sec.)

Hello Time (sec.)

Setting	Description	Factory Default
Numerical value input by user	This specifies the time interval between "hello" messages broadcast by the root of the Spanning Tree topology. The "hello" message is used to check if the topology is healthy.	2

Max. Age (sec.)

Setting	Description	Factory Default
Numerical value input	This specifies the amount of time to wait for a "hello" message	20

by user	from the root before the IKS-6726-8PoE will reconfigure itself as a root. When two or more devices on the network are recognized as a root, the devices will renegotiate to set up a new Spanning Tree topology.	

Enable STP per Port

Setting	Description	Factory Default
Enable/Disable	This includes the selected port as a node on the Spanning Tree topology.	Disabled

NOTE We suggest that you disable the Spanning Tree Protocol for ports that are connected directly to a device (PLC, RTU, etc.) as opposed to network equipment. This will prevent unnecessary negotiation.

Port Priority

Setting	Description	Factory Default
Numerical value selected by user	This specifies the port's priority as a node on the Spanning Tree topology. Lower values correspond to higher priority.	128

Port Cost

Setting	Description	Factory Default
Numerical value input by user	This specifies the port cost. Higher costs correspond to lower suitability as a node for the Spanning Tree topology.	200000

Port Status

Indicates the current Spanning Tree status of this port. **Forwarding** indicates normal transmission and **Blocking** indicates blocked transmission.

Configuration Limits of RSTP/STP

The Spanning Tree Algorithm places limits on three of the configuration items:

[Eq. 1]: 1 sec $\leqq$ Hello Time $\leqq$ 10 sec

[Eq. 2]: 6 sec $\leqq$ Max. Age $\leqq$ 40 sec

[Eq. 3]: 4 sec $\leqq$ Forwarding Delay $\leqq$ 30 sec

These three variables are further restricted by the following two inequalities:

[Eq. 4]: 2 * (Hello Time + 1 sec) $\leqq$ Max. Age $\leqq$ 2 * (Forwarding Delay – 1 sec)

The IKS-6726-8PoE's firmware will alert you immediately if any of these restrictions are violated. For example, suppose Hello Time = 5 sec, Max. Age = 20 sec, and Forwarding Delay = 4 sec. This does not violate Eqs. 1 through 3, but it violates Eq. 4:

2 * (Hello Time + 1 sec) = 12 sec, and 2 * (Forwarding Delay – 1 sec) = 6 sec.

You can remedy the situation in any number of ways. One solution is simply to increase the Forwarding Delay value to at least 11 seconds.

HINT: Take the following steps to avoid guessing:

Step 1: Assign a value to **"Hello Time"** and then calculate the left most part of Eq. 4 to get the lower limit of **Max. Age**.

Step 2: Assign a value to **"Forwarding Delay"** and then calculate the right most part of Eq. 4 to get the upper limit for **Max. Age**.

Step 3: Assign a value to **Forwarding Delay** that satisfies the conditions in Eq. 3 and Eq. 4.

Using Traffic Prioritization

The IKS-6726-8PoE's traffic prioritization capability provides Quality of Service (QoS) to your network by making data delivery more reliable. You can prioritize traffic on your network to ensure that high priority data is transmitted with minimum delay. Traffic can be controlled by a set of rules to obtain the required Quality of Service for your network. The rules define different types of traffic and specify how each type should be treated as it passes through the switch. The IKS-6726-8PoE can inspect both IEEE 802.1p/1Q layer 2 CoS tags, and even layer 3 TOS information to provide consistent classification of the entire network. The IKS-6726-8PoE's QoS capability improves the performance and determinism of industrial networks for mission critical applications.

The Traffic Prioritization Concept

What is Traffic Prioritization?

Traffic prioritization allows you to prioritize data so that time-sensitive and system-critical data can be transferred smoothly and with minimal delay over a network. The benefits of using traffic prioritization are:

- Improve network performance by controlling a wide variety of traffic and managing congestion.
- Assign priorities to different categories of traffic. For example, set higher priorities for time-critical or business-critical applications.
- Provide predictable throughput for multimedia applications, such as video conferencing or voice over IP, and minimize traffic delay and jitter.
- Improve network performance as the amount of traffic grows. This will save cost by reducing the need to keep adding bandwidth to the network.

How Traffic Prioritization Works

Traffic prioritization uses the four traffic queues that are present in your IKS-6726-8PoE to ensure that high priority traffic is forwarded on a different queue from lower priority traffic. This is what provides Quality of Service (QoS) to your network.

The IKS-6726-8PoE traffic prioritization depends on two industry-standard methods:

- **IEEE 802.1D**—a layer 2 marking scheme.
- **Differentiated Services (DiffServ)**—a layer 3 marking scheme.

IEEE 802.1D Traffic Marking

The IEEE Std 802.1D, 1998 Edition marking scheme, which is an enhancement to IEEE Std 802.1D, enables Quality of Service on the LAN. Traffic service levels are defined in the IEEE 802.1Q 4-byte tag, which is used to carry VLAN identification as well as IEEE 802.1p priority information. The 4-byte tag immediately follows the destination MAC address and Source MAC address.

The IEEE Std 802.1D, 1998 Edition priority marking scheme assigns an IEEE 802.1p priority level between 0 and 7 to each frame. This determines the level of service that this type of traffic should receive. Refer to the table below for an example of how different traffic types can be mapped to the eight IEEE 802.1p priority levels.

IEEE 802.1p Priority Level	IEEE 802.1D Traffic Type
0	Best Effort (default)
1	Background
2	Standard (spare)
3	Excellent Effort (business critical)
4	Controlled Load (streaming multimedia)
5	Video (interactive media); less than 100 milliseconds of latency and jitter
6	Voice (interactive voice); less than 10 milliseconds of latency and jitter

7	Network Control Reserved traffic

Even though the IEEE 802.1D standard is the most widely used prioritization scheme in the LAN environment, it still has some restrictions:

- It requires an additional 4-byte tag in the frame, which is normally optional in Ethernet networks. Without this tag, the scheme cannot work.
- The tag is part of the IEEE 802.1Q header, so to implement QoS at layer 2, the entire network must implement IEEE 802.1Q VLAN tagging.

It is only supported on a LAN and not across routed WAN links, since the IEEE 802.1Q tags are removed when the packets pass through a router.

Differentiated Services (DiffServ) Traffic Marking

DiffServ is a Layer 3 marking scheme that uses the DiffServ Code Point (DSCP) field in the IP header to store the packet priority information. DSCP is an advanced intelligent method of traffic marking because you can choose how your network prioritizes different types of traffic. DSCP uses 64 values that map to user-defined service levels, allowing you to establish more control over network traffic.

Advantages of DiffServ over IEEE 802.1D are:

- Configure how you want your switch to treat selected applications and types of traffic by assigning various grades of network service to them.
- No extra tags are required in the packet.
- DSCP uses the IP header of a packet and therefore priority is preserved across the Internet.
- DSCP is backward compatible with IPV4 TOS, which allows operation with existing devices that use a layer 3 TOS enabled prioritization scheme.

Traffic Prioritization

The IKS-6726-8PoE classifies traffic based on layer 2 of the OSI 7 layer model, and the switch prioritizes received traffic according to the priority information defined in the received packet. Incoming traffic is classified based upon the IEEE 802.1D frame and is assigned to the appropriate priority queue based on the IEEE 802.1p service level value defined in that packet. Service level markings (values) are defined in the IEEE 802.1Q 4-byte tag, and consequently traffic will only contain 802.1p priority markings if the network is configured with VLANs and VLAN tagging. The traffic flow through the switch is as follows:

A packet received by the IKS-6726-8PoE may or may not have an 802.1p tag associated with it. If it does not, then it is given a default 802.1p tag (which is usually 0). Alternatively, the packet may be marked with a new 802.1p value, which will result in all knowledge of the old 802.1p tag being lost.

Because the 802.1p priority levels are fixed to the traffic queues, the packet will be placed in the appropriate priority queue, ready for transmission through the appropriate egress port. When the packet reaches the head of its queue and is about to be transmitted, the device determines whether or not the egress port is tagged for that VLAN. If it is, then the new 802.1p tag is used in the extended 802.1D header.

The IKS-6726-8PoE will check a packet received at the ingress port for IEEE 802.1D traffic classification, and then prioritize it based upon the IEEE 802.1p value (service levels) in that tag. It is this 802.1p value that determines which traffic queue the packet is mapped to.

Traffic Queues

The IKS-6726-8PoE hardware has multiple traffic queues that allow packet prioritization to occur. Higher priority traffic can pass through the IKS-6726-8PoE without being delayed by lower priority traffic. As each packet arrives in the IKS-6726-8PoE, it passes through any ingress processing (which includes classification, marking/re-marking), and is then sorted into the appropriate queue. The switch then forwards packets from each queue.

The IKS-6726-8PoE supports two different queuing mechanisms:

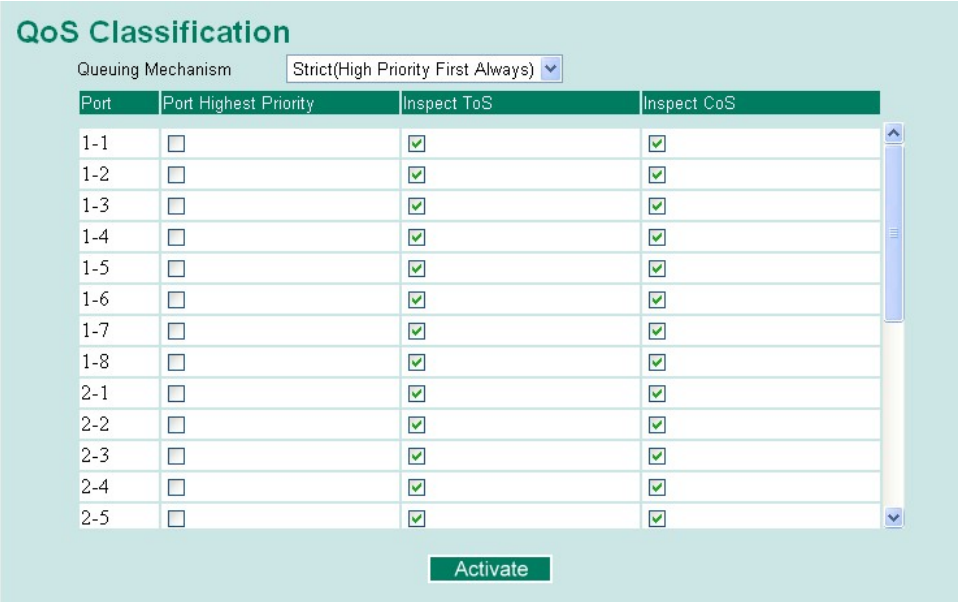
- Weight Fair: This method services all the traffic queues, giving priority to the higher priority queues. Under most circumstances, this method gives high priority precedence over low-priority, but in the event that high-priority traffic except the link capacity, lower priority traffic is not blocked.

- Strict: This method services high traffic queues first; low priority queues are delayed until no more high priority data needs to be sent. This method always gives precedence to high priority over low-priority.

Configuring Traffic Prioritization

Quality of Service (QoS) provides a traffic prioritization capability to ensure that important data is delivered consistently and predictably. The IKS-6726-8PoE can inspect IEEE 802.1p/1Q layer 2 CoS tags, and even layer 3 TOS information, to provide a consistent classification of the entire network. The IKS-6726-8PoE' QoS capability improves your industrial network's performance and determinism for mission critical applications.

QoS Classification



The IKS-6726-8PoE supports inspection of layer 3 TOS and/or layer 2 CoS tag information to determine how to classify traffic packets.

Queuing Mechanism

Setting	Description	Factory Default
Weight Fair	IKS-6726-8PoE has 4 priority queues. In the weight fair scheme, an 8, 4, 2, 1 weighting is applied to the four priorities. This approach prevents the lower priority frames from being starved of opportunity for transmission with only a slight delay to the higher priority frames.	Weight Fair
Strict	In the Strict-priority scheme, all top-priority frames egress a port until that priority's queue is empty, and then the next lower priority queue's frames egress. This approach can cause the lower priorities to be starved of opportunity for transmitting any frames but ensures all high priority frames to egress the switch as soon as possible.	

Inspect TOS

Setting	Description	Factory Default
Enable/Disable	This enables or disables the IKS-6726-8PoE to inspect the Type of Service (TOS) bits in IPV4 frame to determine the priority of each frame.	Enable

Inspect COS

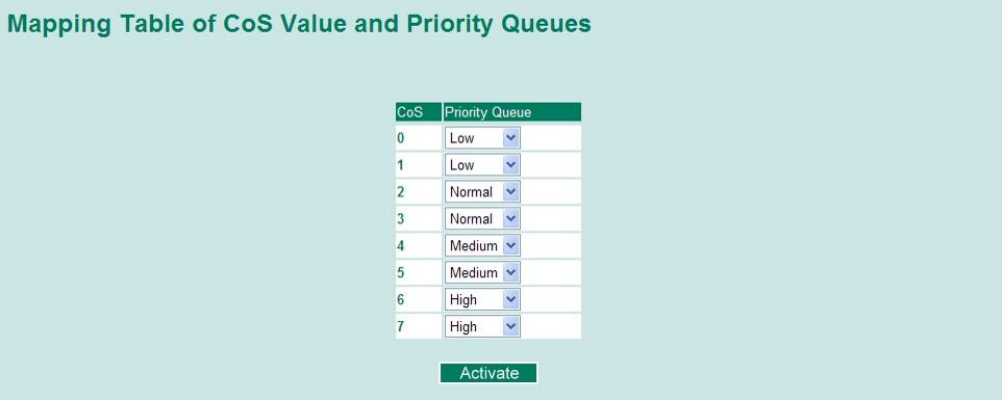
Setting	Description	Factory Default
Enable/Disable	This enables or disables the IKS-6726-8PoE to inspect the	Enable

	802.1p COS tag in the MAC frame to determine the priority of each frame.	

NOTE The priority of an ingress frame is determined in order by:
1. Inspect TOS
2. Inspect CoS
3. Port Highest Priority

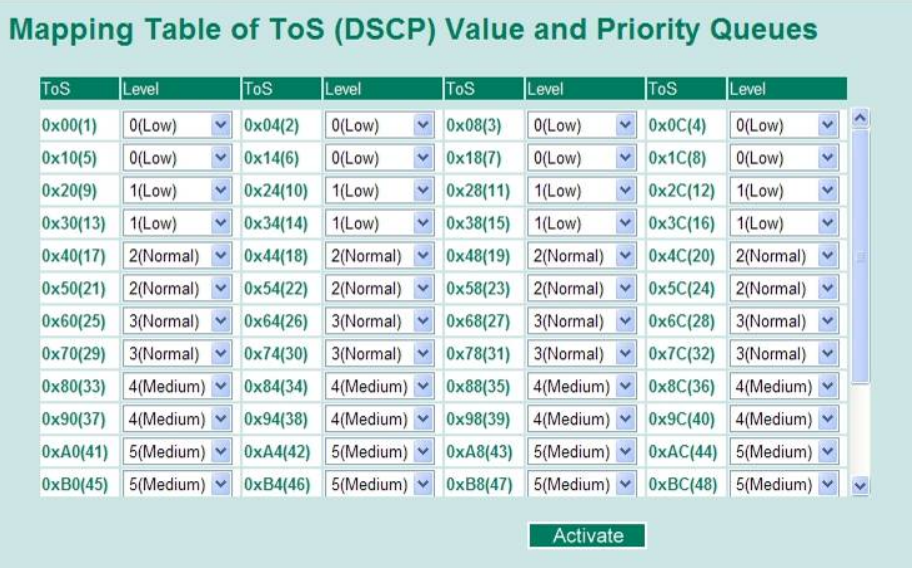
NOTE The designer can enable these classifications individually or in combination. For instance, if a "hot," higher priority port is required for a network design, "Inspect TOS" and "Inspect CoS" can be disabled. This setting leaves only port default priority active, which results in all ingress frames being assigned the same priority on that port.

CoS Mapping



Setting	Description	Factory
Low/Normal/ Medium/High	This maps different CoS values to 4 different egress queues.	0: Low 1: Low 2: Normal 3: Normal 4: Medium 5: Medium 6: High 7: High

TOS/DiffServ Mapping



Setting	Description	Factory Default
Low/Normal/ Medium/High	This maps different TOS values to 4 different egress queues.	1 to 16: Low 17 to 32: Normal 33 to 48: Medium 49 to 64: High

Using Virtual LAN

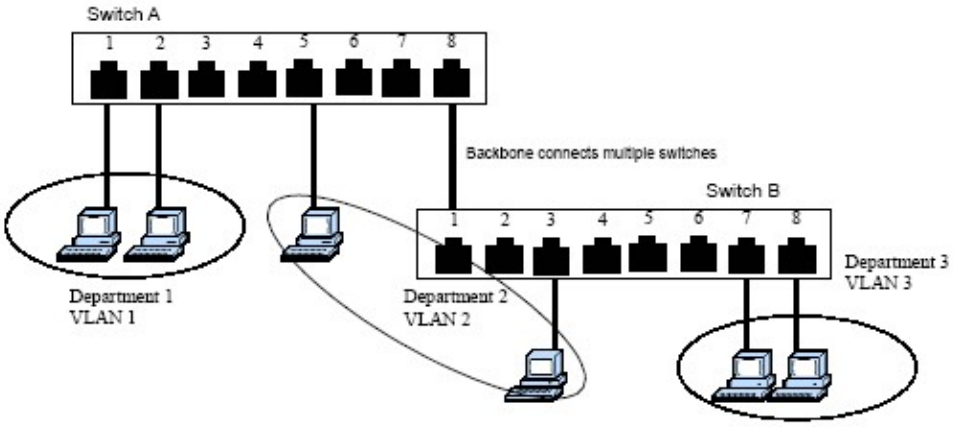
Setting up Virtual LANs (VLANs) on your IKS-6726-8PoE increases the efficiency of your network by dividing the LAN into logical segments, as opposed to physical segments. In general, VLANs are easier to manage.

The Virtual LAN (VLAN) Concept

What is a VLAN?

A VLAN is a group of devices that can be located anywhere on a network, but which communicate as if they are on the same physical segment. With VLANs, you can segment your network without being restricted by physical connections—a limitation of traditional network design. As an example, with VLANs you can segment your network according to:

- **Departmental groups**—You could have one VLAN for the marketing department, another for the finance department, and another for the product development department.
- **Hierarchical groups**—You could have one VLAN for directors, another for managers, and another for general staff.
- **Usage groups**—You could have one VLAN for email users and another for multimedia users.



Benefits of VLANs

The main benefit of VLANs is that they provide a network segmentation system that is far more flexible than traditional networks. Using VLANs also provides you with three other benefits:

- **VLANs ease the relocation of devices on networks.** With traditional networks, network administrators spend much of their time dealing with moves and changes. If users move to a different subnetwork, the addresses of each host must be updated manually. With a VLAN setup, if a host on VLAN Marketing, for example, is moved to a port in another part of the network, and retains its original subnet membership, you only need to specify that the new port is on VLAN Marketing. You do not need to carry out any re-cabling.
- **VLANs provide extra security.** Devices within each VLAN can only communicate with other devices on the same VLAN. If a device on VLAN *Marketing* needs to communicate with devices on VLAN *Finance*, the traffic must pass through a routing device or Layer 3 switch.

- **VLANs help control traffic.** With traditional networks, congestion can be caused by broadcast traffic that is directed to all network devices, regardless of whether or not they need it. VLANs increase the efficiency of your network because each VLAN can be set up to contain only those devices that need to communicate with each other.

VLANs and the Rackmount switch

Your IKS-6726-8PoE provides support for VLANs using IEEE Std 802.1Q-1998. This standard allows traffic from multiple VLANs to be carried across one physical link. The IEEE Std 802.1Q-1998 standard allows each port on your IKS-6726-8PoE to be placed as follows:

- In a single VLAN defined on the IKS-6726-8PoE
- In several VLANs simultaneously using 802.1Q tagging

The standard requires that you define the *802.1Q VLAN ID* about each VLAN on your IKS-6726-8PoE before the switch can use it to forward traffic:

Managing a VLAN

A new or initialized IKS-6726-8PoE contains a single VLAN—the Default VLAN. This VLAN has the following definition:

- *VLAN Name*—Management VLAN
- *802.1Q VLAN ID*—1 (if tagging is required)

All the ports are initially placed in this VLAN, and it is the only VLAN that allows you to access the management software of the IKS-6726-8PoE over the network.

Communication Between VLANs

If devices connected to a VLAN need to communicate to devices on a different VLAN, a router or Layer 3 switching device with connections to both VLANs needs to be installed. Communication between VLANs can only take place if they are all connected to a routing or Layer 3 switching device.

VLANs: Tagged and Untagged Membership

The IKS-6726-8PoE supports 802.1Q VLAN tagging, a system that allows traffic for multiple VLANs to be carried on a single physical (backbone, trunk) link. When setting up VLANs you need to understand when to use untagged and tagged membership of VLANs. Simply put, if a port is on a single VLAN it can be an untagged member, but if the port needs to be a member of multiple VLANs, tagged membership must be defined.

A typical host (e.g., clients) will be untagged members of one VLAN, defined as **Access Port** in IKS-6726-8PoE, while inter-switch connections will be tagged members of all VLANs, defined as Trunk Port in IKS-6726-8PoE.

The IEEE Std 802.1Q-1998 defines how VLANs operate within an open packet-switched network. An 802.1Q compliant packet carries additional information that allows a switch to determine which VLAN the port belongs to. If a frame is carrying the additional information, it is known as a *tagged* frame.

To carry multiple VLANs across a single physical (backbone, trunk) link, each packet must be tagged with a VLAN identifier so that the switches can identify which packets belong in which VLAN. To communicate between VLANs, a router must be used.

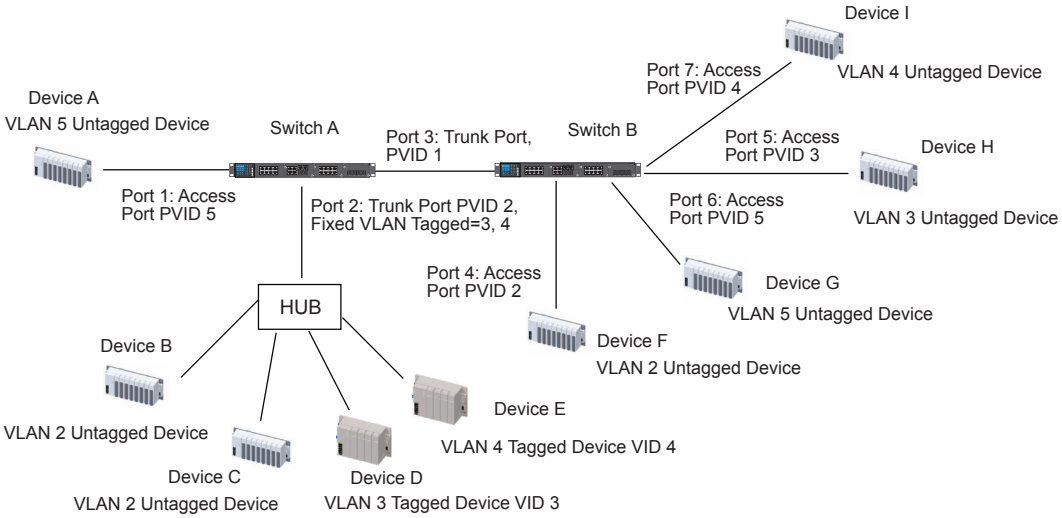
The IKS-6726-8PoE supports two types of VLAN port settings:

- **Access Port:** The port connects to a single device that is not tagged. The user must define the default port PVID that assigns which VLAN the device belongs to. Once the ingress packet of this Access Port egresses to another Trunk Port (the port needs all packets to carry tag information), IKS-6726-8PoE will insert this PVID into this packet to help the next 802.1Q VLAN switch recognize it.

- **Trunk Port:** The port connects to a LAN that consists of untagged devices/tagged devices and/or switches and hubs. In general, the traffic of the Trunk Port must have a Tag. Users can also assign PVID to a Trunk Port. The untagged packet on the Trunk Port will be assigned the port default PVID as its VID.

The following section illustrates how to use these ports to set up different applications.

Sample Applications of VLANs using IKS-6726-8PoE



In this application,

- Port 1 connects a single untagged device and assigns it to VLAN 5; it should be configured as **Access Port with PVID 5**.
- Port 2 connects a LAN with two untagged devices belonging to VLAN 2. One tagged device with VID 3 and one tagged device with VID 4. It should be configured as **Trunk Port** with PVID 2 for untagged device and Fixed VLAN (Tagged) with 3 and 4 for tagged device. Since each port can only have one unique PVID, all untagged devices on the same port can only belong to the same VLAN.
- Port 3 connects with another switch. It should be configured as **Trunk Port** GVRP protocol will be used through the Trunk Port.
- Port 4 connects a single untagged device and assigns it to VLAN 2; it should be configured as **Access Port** with PVID 2.
- Port 5 connects a single untagged device and assigns it to VLAN 3; it should be configured as **Access Port** with PVID 3.
- Port 6 connect a single untagged device and assigns it to VLAN 5; it should be configured as Access Port with PVID 5.
- Port 7 connects a single untagged device and assigns it to VLAN 4; it should be configured as **Access Port** with PVID 4.

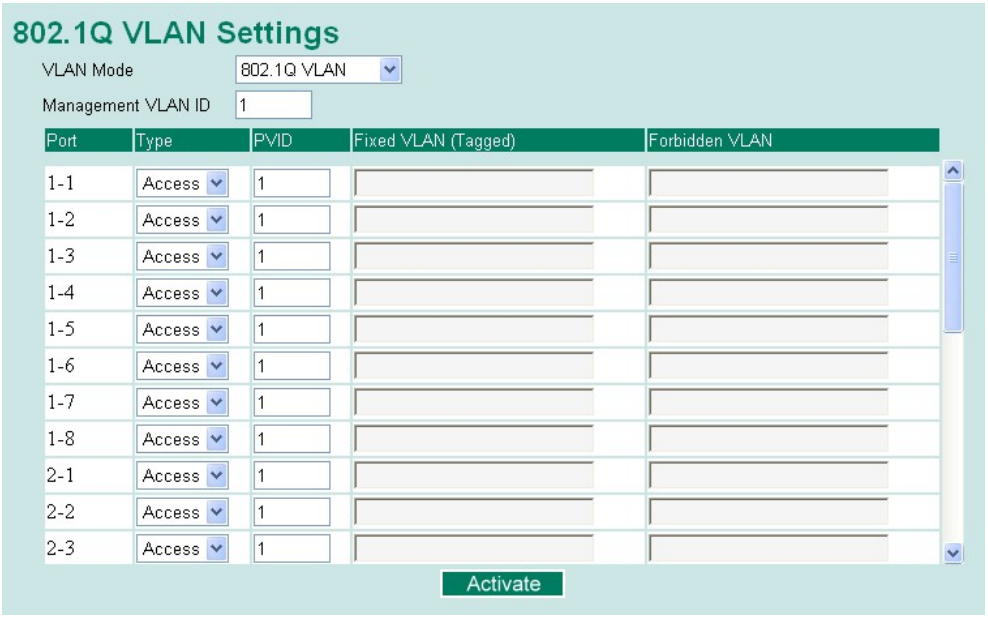
After proper configuration:

- Packets from Device A will travel through **Trunk Port 3** with tagged VID 5. Switch B will recognize its VLAN, pass it to port 6, and then remove tags received successfully by Device G, and vice versa.
- Packets from Devices B and C will travel through **Trunk Port 3** with tagged VID 2. Switch B recognizes its VLAN, passes it to port 4, and then removes tags received successfully by Device F, and vice versa.
- Packets from Device D will travel through **Trunk Port 3** with tagged VID 3. Switch B will recognize its VLAN, pass to port 5, and then remove tags received successfully by Device H. Packets from Device H will travel through **Trunk Port 3** with PVID 3. Switch A will recognize its VLAN and pass it to port 2, but will not remove tags received successfully by Device D.
- Packets from Device E will travel through **Trunk Port 3** with tagged VID 4. Switch B will recognize its VLAN, pass it to port 7, and then remove tags received successfully by Device I. Packets from Device I will travel through **Trunk Port 3** with tagged VID 4. Switch A will recognize its VLAN and pass it to port 2, but will not remove tags received successfully by Device E.

Configuring Virtual LAN

VLAN Settings

To configure **802.1Q VLAN** on the IKS-6726-8PoE, use the VLAN Setting page to configure the ports.



VLAN Mode

Setting	Description	Factory Default
802.1Q VLAN	Set VLAN mode to 802.1Q VLAN	802.1Q VLAN
Port-based VLAN	Set VLAN mode to Port-based VLAN	

Management VLAN ID

Setting	Description	Factory Default
VLAN ID from 1 to 4094	This assigns the VLAN ID of this IKS-6726-8PoE.	1

Port Type

Setting	Description	Factory Default
Access	This port type is used to connect single devices without tags.	Access
Trunk	Select Trunk port type to connect another 802.1Q VLAN aware switch or another LAN that combines tagged and/or untagged devices and/or other switches/hubs.	

ATTENTION

For communication redundancy in the VLAN environment, set **Redundant Port Coupling Port** and **Coupling Control Port** as **Trunk Port** since these ports act as the **backbone** to transmit all packets of different VLANs to different IKS-6726-8PoE units.

Port PVID

Setting	Description	Factory Default
VID range from 1 to 4094	This sets the default VLAN ID for untagged devices that connect to the port.	1

Fixed VLAN List (Tagged)

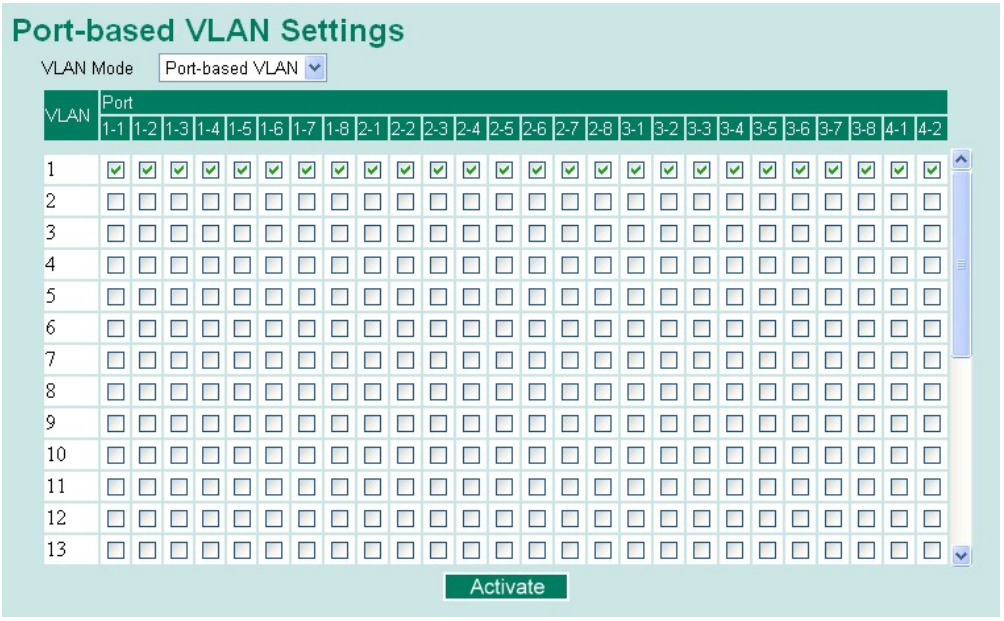
Setting	Description	Factory Default
VID range from 1 to	This field will be active only when selecting the Trunk port type.	None

4094	Set the other VLAN ID for tagged devices that connect to the Trunk port. Use commas to separate different VIDs.	

Forbidden VLAN List

Setting	Description	Factory Default
VID range from 1 to 4094	This field will be active only when selecting the Trunk port type. Set the VLAN IDs that will not be supported by this trunk port. Use commas to separate different VIDs.	None

To configure the IKS-6726-8PoE's **port-based VLAN**, use the VLAN settings page to configure the ports.



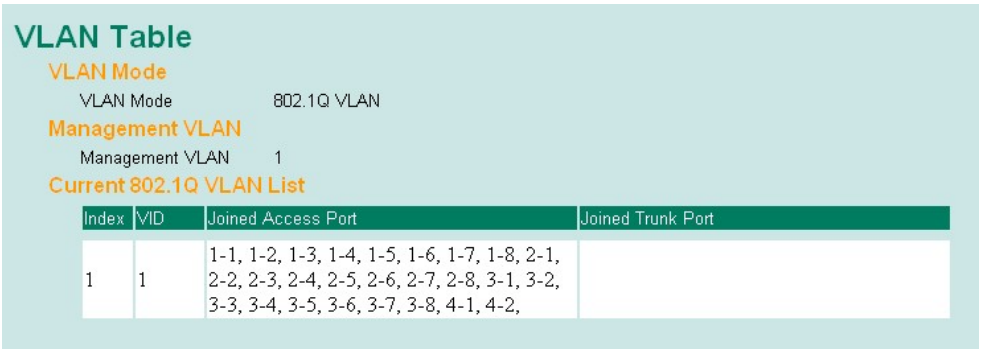
VLAN Mode

Setting	Description	Factory Default
802.1Q VLAN	Set VLAN mode to 802.1Q VLAN	802.1Q VLAN
Port-based VLAN	Set VLAN mode to Port-based VLAN	

Port

Setting	Description	Factory Default
Enable/Disable	Set port to specific VLAN Group.	Enable (all ports belong to VLAN1)

VLAN Table



In 802.1Q VLAN table, you can review the VLAN groups that were created, Joined Access Ports, and Trunk Ports, and in Port-based VLAN table, you can review the VLAN group and Joined port.

NOTE The physical network can have a maximum of 64 VLAN settings.

Using Multicast Filtering

Multicast filtering improves the performance of networks that carry multicast traffic. This section explains multicasts, multicast filtering, and how multicast filtering can be implemented on your IKS-6726-8PoE.

The Concept of Multicast Filtering

What is an IP Multicast?

A *multicast* is a packet sent by one host to multiple hosts. Only those hosts that belong to a specific multicast group will receive the multicast. If the network is set up correctly, a multicast can only be sent to an end-station or a subset of end-stations on a LAN or VLAN that belong to the multicast group. Multicast group members can be distributed across multiple subnets, so that multicast transmissions can occur within a campus LAN or over a WAN. In addition, networks that support IP multicast send only *one* copy of the desired information across the network until the delivery path that reaches group members diverges. To make more efficient use of network bandwidth, it is only at these points that multicast packets are duplicated and forwarded. A multicast packet has a multicast group address in the destination address field of the packet's IP header.

Benefits of Multicast

The benefits of using IP multicast are that it:

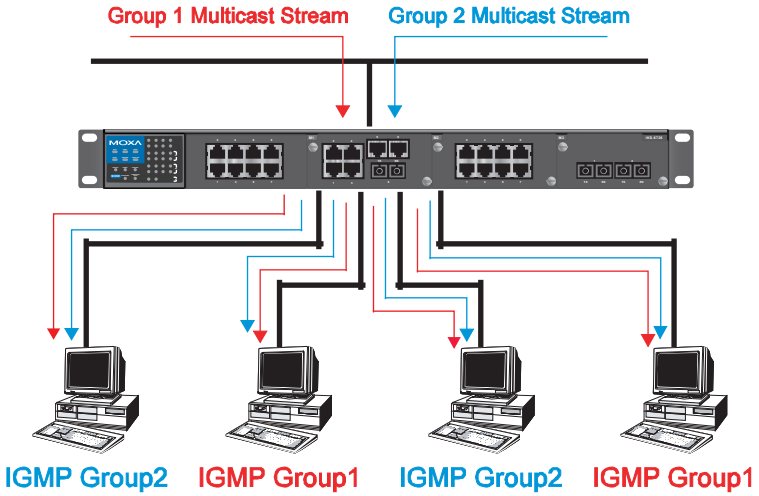
- Uses the most efficient, sensible method to deliver the same information to many receivers with only one transmission.
- Reduces the load on the source (for example, a server) since it will not need to produce several copies of the same data.
- Makes efficient use of network bandwidth and scales well as the number of multicast group members increases.
- Works with other IP protocols and services, such as Quality of Service (QoS).

Multicast transmission makes more sense and is more efficient than unicast transmission for some applications. For example, multicasts are often used for video-conferencing, since high volumes of traffic must be sent to several end-stations at the same time, but where broadcasting the traffic to all end-stations would cause a substantial reduction in network performance. Furthermore, several industrial automation protocols, such as Allen-Bradley, EtherNet/IP, Siemens Profibus, and Foundation Fieldbus HSE (High Speed Ethernet), use multicast. These industrial Ethernet protocols use publisher/subscriber communications models by multicasting packets that could flood a network with heavy traffic. IGMP Snooping is used to prune multicast traffic so that it travels only to those end destinations that require the traffic, reducing the amount of traffic on the Ethernet LAN.

Multicast Filtering

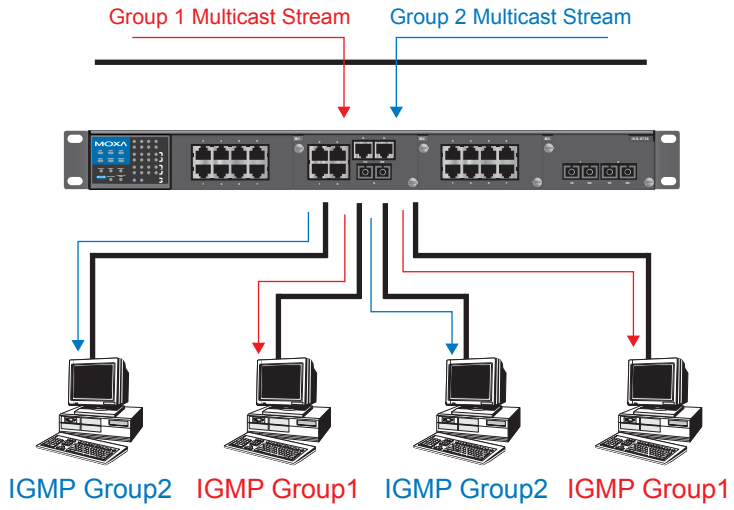
Multicast filtering ensures that only end-stations that have joined certain groups receive multicast traffic. With multicast filtering, network devices only forward multicast traffic to the ports that are connected to registered end-stations. The following two figures illustrate how a network behaves without multicast filtering, and with multicast filtering.

Network without multicast filtering



All hosts receive the multicast traffic, even if they don't need it.

Network with multicast filtering



Hosts only receive dedicated traffic from other hosts belonging to the same group.

Multicast Filtering and Moxa's Industrial Rackmount switches

The IKS-6726-8PoE has three ways to achieve multicast filtering: IGMP (Internet Group Management Protocol) Snooping, GMRP (GARP Multicast Registration Protocol), and adding a static multicast MAC manually to filter multicast traffic automatically.

IGMP (Internet Group Management Protocol)

Snooping Mode

Snooping Mode allows your switch to forward multicast packets only to the appropriate ports. The switch **snoops** on exchanges between hosts and an IGMP device, such as a router, to find those ports that want to join a multicast group, and then configures its filters accordingly.

IGMP Snooping Enhanced Mode

Snooping Enhanced Mode allows your switch to forward multicast packets to the IKS-6726-8PoE's member port only. If you disable Enhanced Mode, data streams will run to the querier port as well as the member port.

Query Mode

Query mode allows the IKS-6726-8PoE to work as the Querier if it has the lowest IP address on the subnetwork to which it belongs. IGMP querying is enabled by default on the IKS-6726-8PoE to help prevent interoperability issues with some multicast routers that may not follow the lowest IP address election method. Enable query mode to run multicast sessions on a network that does not contain IGMP routers (or queriers).

NOTE IKS-6726-8PoE is compatible with any device that conforms to the IGMP v2 and IGMP v3 device protocol.

IGMP Multicast Filtering

IGMP is used by IP-supporting network devices to register hosts with multicast groups. It can be used on all LANs and VLANs that contain a multicast capable IP router, and on other network devices that support multicast filtering. IGMP works as follows:

The IP router (or querier) periodically sends *query* packets to all end-stations on the LANs or VLANs that are connected to it. For networks with more than one IP router, the router with the lowest IP address is the querier. A switch with IP address lower than the IP address of any other IGMP queriers connected to the LAN or VLAN can become the IGMP querier.

When an IP host receives a query packet, it sends a *report* packet back that identifies the multicast group that the end-station would like to join.

When the report packet arrives at a port on a switch with *IGMP Snooping* enabled, the switch knows that the port should forward traffic for the multicast group, and then proceeds to forward the packet to the router.

When the router receives the report packet, it registers that the LAN or VLAN requires traffic for the multicast groups.

When the router forwards traffic for the multicast group to the LAN or VLAN, the switches only forward the traffic to ports that received a report packet.

GMRP (GARP Multicast Registration Protocol)

The IKS-6726-8PoE supports IEEE 802.1D-1998 GMRP (GARP Multicast Registration Protocol), which differs from IGMP (Internet Group Management Protocol). GMRP is a MAC-based multicast management protocol, whereas IGMP is IP-based. GMRP provides a mechanism that allows bridges and end stations to register or de-register Group membership information dynamically. GMRP functions similarly to GVRP, except that GMRP registers multicast addresses on ports. When a port receives a ***GMRP-join*** message, it will register the multicast address to its database if the multicast address is not registered, and all the multicast packets with that multicast address are able to be forwarded from this port. When a port receives a ***GMRP-leave*** message, it will de-register the multicast address from its database, and all the multicast packets with this multicast address are not able to be forwarded from this port.

Static Multicast MAC

Some devices may only support multicast packets, but not support either IGMP Snooping or GMRP. The IKS-6726-8PoE supports adding multicast groups manually to enable multicast filtering.

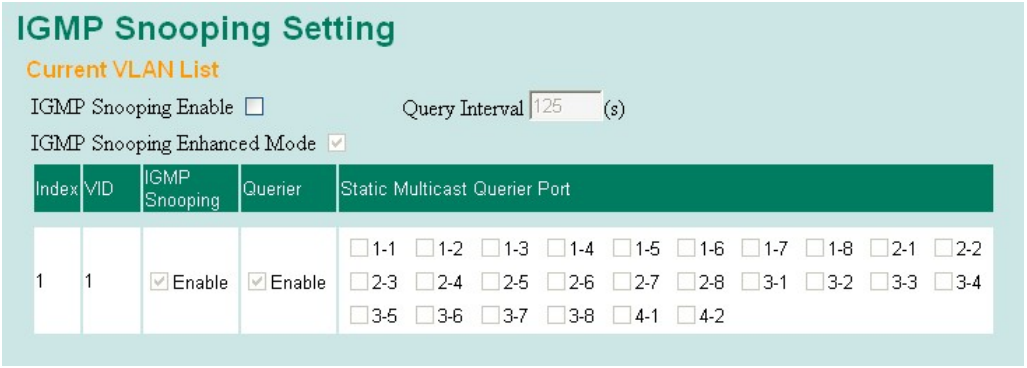
Enabling Multicast Filtering

Use the serial console or Web interface to enable or disable IGMP Snooping and IGMP querying. If IGMP Snooping is not enabled, then IP multicast traffic is always forwarded, flooding the network.

Configuring IGMP Snooping

IGMP Snooping provides the ability to prune multicast traffic so that it travels only to those end destinations that require that traffic, thereby reducing the amount of traffic on the Ethernet LAN.

IGMP Snooping Settings



IGMP Snooping Enable

Setting	Description	Factory Default
Enable/Disable	Click the checkbox to enable the IGMP Snooping function globally.	Disabled

(Enable IGMP Snooping if the network also uses 3rd party switches.)

Query Interval

Setting	Description	Factory Default
Numerical value input by user	This sets the query interval of the Querier function globally. Valid settings are from 20 to 600 seconds.	125 seconds

IGMP Snooping Enhanced Mode

Setting	Description	Factory Default
Enable	IGMP Multicast packets will be forwarded to: - Auto-Learned Multicast Querier Ports - Member Ports	Enable
Disable	IGMP Multicast packets will be forwarded to: - Auto-Learned Multicast Querier Ports - Static Multicast Querier Ports - Querier Connected Ports - Member Ports	

(You should only enable IGMP Snooping Enhanced Mode when all switches on the network are Moxa switches.)

IGMP Snooping

Setting	Description	Factory Default
Enable/Disable	This enables or disables the IGMP Snooping function per VLAN.	Enabled if IGMP Snooping Enabled Globally

Querier

Setting	Description	Factory Default
Enable/Disable	This enables or disables the IKS-6726-8PoE's querier function.	Enabled if IGMP Snooping is Enabled Globally

Static Multicast Querier Port

Setting	Description	Factory Default
Select/Deselect	This selects the ports that will connect to the multicast routers. It is active only when IGMP Snooping is enabled.	Disabled

NOTE If a router or layer 3 switch is connected to the network, it will act as the Querier; thus, this Querier option will be disabled on all Moxa layer 2 switches.
If all switches on the network are Moxa layer 2 switches, then only one layer 2 switch will act as Querier.

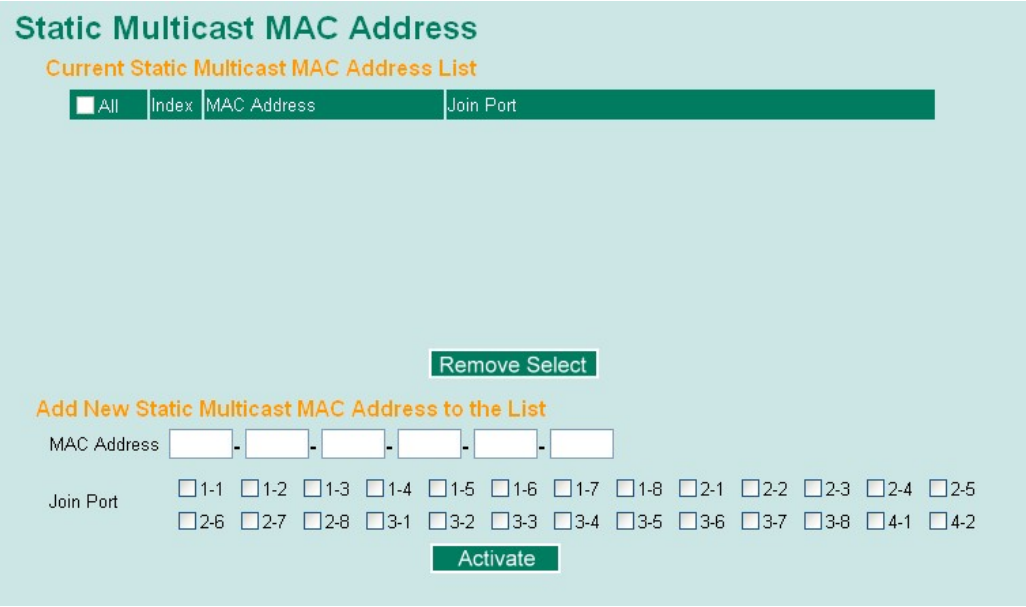
IGMP Table

The IKS-6726-8PoE displays the current active IGMP groups that were detected.

The information includes **VID**, **Auto-learned Multicast Router Port**, **Static Multicast Router Port**, **Querier Connected Port**, and the **IP** and **MAC** addresses of active IGMP groups.

Add Static Multicast MAC

If required, the IKS-6726-8PoE also supports adding multicast groups manually.



Add New Static Multicast Address to the List

Setting	Description	Factory Default
MAC Address	Input the multicast MAC address of this host.	None

MAC Address

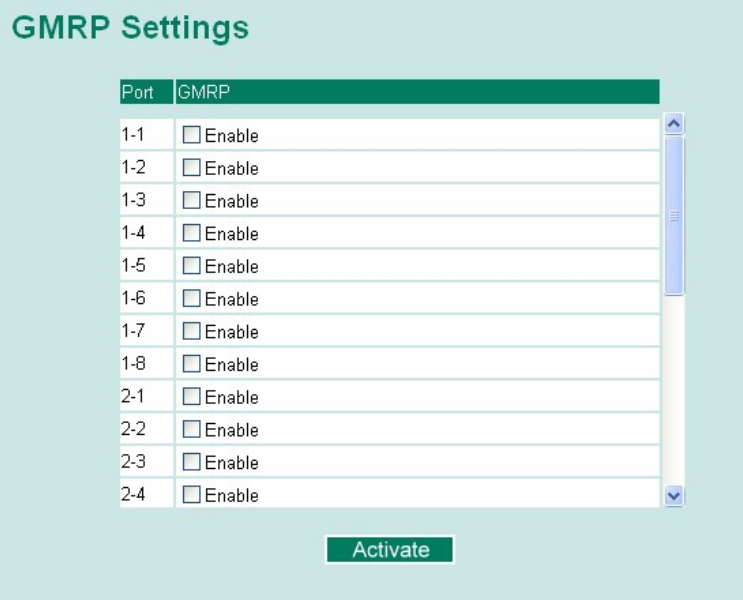
Setting	Description	Factory Default
Integer	Input the number of the VLAN that the host with this MAC address belongs to.	None

Join Port

Setting	Description	Factory Default
Select/Deselect	Checkmark the appropriate check boxes to select the join ports for this multicast group.	None

Configuring GMRP

GMRP is a MAC-based multicast management protocol, whereas IGMP is IP-based. GMRP provides a mechanism that allows bridges and end stations to register or un-register Group membership information dynamically.



GMRP enable

Setting	Description	Factory Default
Enable/Disable	This enables or disables the GMRP function for the port listed in the Port column	Disable

GMRP Table

The IKS-6726-8PoE displays the current active GMRP groups that were detected

Setting	Description
Fixed Ports	This multicast address is defined by static multicast.
Learned Ports	This multicast address is learned by GMRP.

Using Bandwidth Management

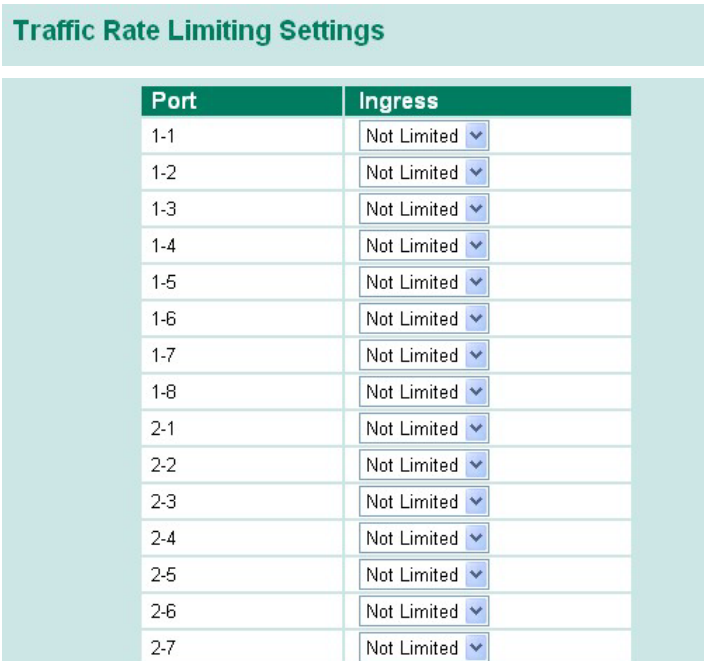
In general, one host should not be allowed to occupy unlimited bandwidth, particularly when the device malfunctions. For example, so-called "broadcast storms" could be caused by an incorrectly configured topology, or a malfunctioning device. The IKS-6726-8PoE not only prevents broadcast storms, but can also be configured to a different ingress rate for all packets, giving administrators full control of their limited bandwidth to prevent undesirable effects caused by unpredictable faults.

Configuring Bandwidth Management

Broadcast Storm Protection

Setting	Description	Factory Default
Enable/Disable	This enables or disables Broadcast Storm Protection for unknown broadcast packet globally.	Enable
	This enables or disables Broadcast Storm Protection for unknown multicast packets globally.	Disable

Traffic Rate Limiting Settings



Ingress

Setting	Description	Factory Default
Ingress rate	Select the ingress rate for all packets from the following options: not limited, 3%, 5%, 10%, 15%, 25%, 35%, 50%, 65%, 85%	N/A

Using Port Access Control

The IKS-6726-8PoE provides two kinds of Port-Base Access Control. One is Static Port Lock and the other is IEEE 802.1X.

Static Port Lock

The IKS-6726-8PoE can also be configured to protect static MAC addresses for a specific port. With the Port Lock function, these locked ports will not learn any additional addresses, but only allow traffic from preset static MAC addresses, helping to block hackers and careless usage.

IEEE 802.1X

The IEEE 802.1X standard defines a protocol for client/server-based access control and authentication. The protocol restricts unauthorized clients from connecting to a LAN through ports that are open to the Internet, and which otherwise would be readily accessible. The purpose of the authentication server is to check each client that requests access to the port. The client is only allowed access to the port if the client's permission is authenticated.

The IEEE 802.1X Concept

Three components are used to create an authentication mechanism based on 802.1X standards: Client/Supplicant, Authentication Server, and Authenticator.

Supplicant: The end station that requests access to the LAN and switch services and responds to the requests from the switch.

Authentication server: The server that performs the actual authentication of the supplicant.

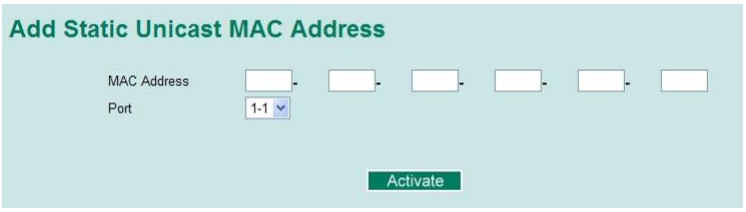
Authenticator: Edge switch or wireless access point that acts as a proxy between the supplicant and the authentication server, requesting identity information from the supplicant, verifying the information with the authentication server, and relaying a response to the supplicant.

The IKS-6726-8PoE acts as an authenticator in the 802.1X environment. A supplicant and an authenticator exchange EAPOL (Extensible Authentication Protocol over LAN) frames with each other. We can either use an external RADIUS server as the authentication server, or implement the authentication server in IKS-6726-8PoE by using a Local User Database as the authentication look-up table. When we use an external RADIUS server as the authentication server, the authenticator and the authentication server exchange EAP frames between each other.

Authentication can be initiated either by the supplicant or the authenticator. When the supplicant initiates the authentication process, it sends an **EAPOL-Start** frame to the authenticator. When the authenticator initiates the authentication process or when it receives an **EAPOL Start** frame, it sends an **EAP Request/Identity** frame to ask for the username of the supplicant.

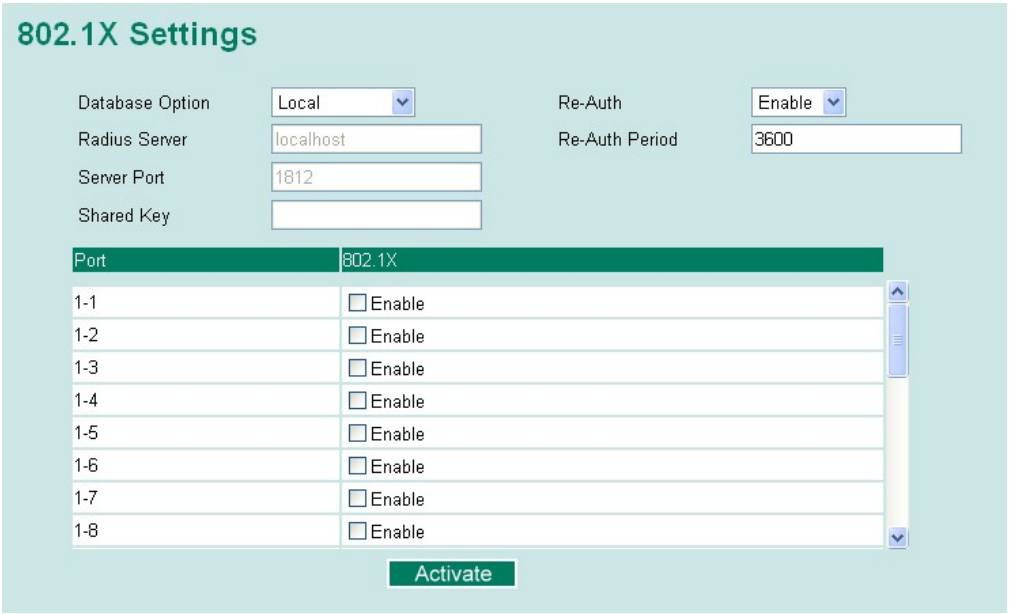
Configuring Static Port Lock

The IKS-6726-8PoE supports adding unicast groups manually if required.



Setting	Description	Factory Default
MAC Address	Add the static unicast MAC address into the address table.	None
Port	Fix the static address with a dedicated port.	1-1

Configuring IEEE 802.1X



Database Option

Setting	Description	Factory Default
Local (Max. 32 users)	Select this option when setting the Local User Database as the authentication database.	Local
Radius	Select this option to set an external RADIUS server as the authentication database. The authentication mechanism is EAP-MD5.	Local
Radius, Local	Select this option to make using an external RADIUS server as	Local

	the authentication database the first priority. The authentication mechanism is EAP-MD5 The first priority is to set the Local User Database as the authentication database.	

Radius Server

Setting	Description	Factory Default
IP address or domain name	The IP address or domain name of the RADIUS server	local host

Server Port

Setting	Description	Factory Default
Numerical	The UDP port of the RADIUS server	1812

Shared Key

Setting	Description	Factory Default
alphanumeric (Max. 40 characters)	A key to be shared between the external RADIUS server and IKS-6726-8PoE. Both ends must be configured to use the same key.	None

Re-Auth

Setting	Description	Factory Default
Enable/Disable	Select to require re-authentication of the client after a preset time period of no activity has elapsed.	Disable

Re-Auth Period

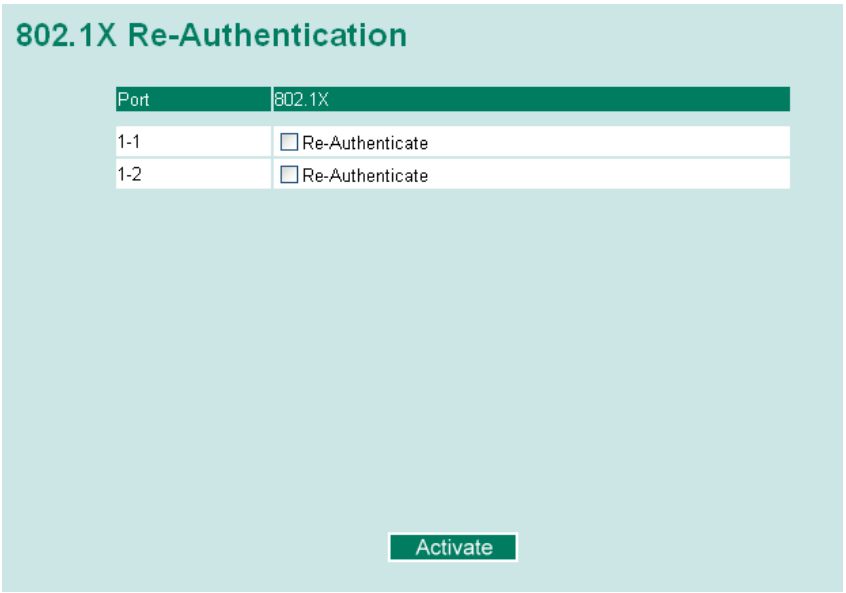
Setting	Description	Factory Default
Numerical (60 to 65535 sec.)	Specify how frequently the end stations need to reenter usernames and passwords in order to stay connected.	3600

802.1X

Setting	Description	Factory Default
Enable/Disable	Click the checkbox under the 802.1X column to enable IEEE 802.1X for one or more ports. All end stations must enter usernames and passwords before access to these ports is allowed.	Disable

802.1X Re-Authentication

The IKS-6726-8PoE can force connected devices to be re-authorized manually.

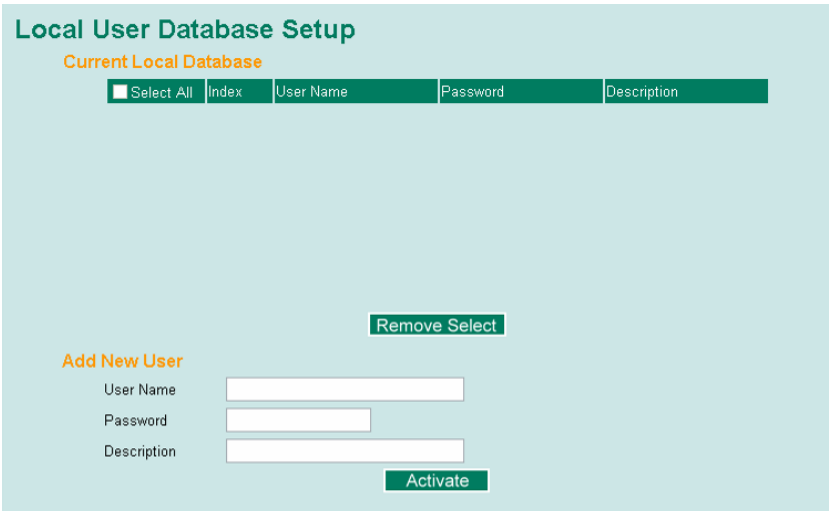


802.1X Re-Authentication

Setting	Description	Factory Default
Enable/Disable	This enables or disables 802.1X Re-Authentication	Disable

Local User Database Setup

When setting the Local User Database as the authentication database, set the database first.



Local User Database Setup

Setting	Description	Factory Default
User Name (Max. 30 characters)	User Name for Local User Database	None
Password (Max. 16 characters)	Password for Local User Database	None
Description (Max. 30 characters)	Description for Local User Database	None

NOTE The user name for the Local User Database is case-insensitive.

Port Access Control Table

The port status will show authorized or unauthorized.

Using Auto Warning

Since industrial Ethernet devices are often located at the endpoints of a system, these devices will not always know what is happening elsewhere on the network. This means that an industrial Ethernet switch that connects to these devices must provide system maintainers with real-time alarm messages. Even when control engineers are out of the control room for an extended period of time, they can still be informed of the status of devices almost instantaneously when exceptions occur. The IKS-6726-8PoE supports different approaches to warn engineers automatically, such as email and relay output. It also supports two digital inputs to integrate sensors into your system to automate alarms by email and relay output.

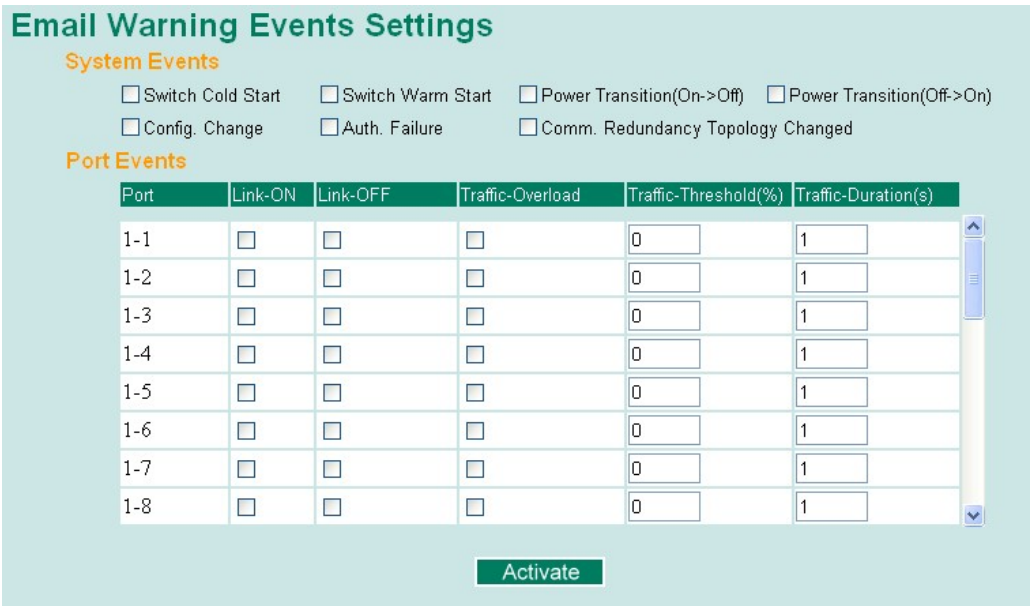
Configuring Email Warning

The Auto Email Warning function uses e-mail to alert the user when certain user-configured events take place.

Three basic steps are required to set up the Auto Warning function:

1. **Configuring Email Event Types**
   Select the desired **Event types** from the Console or Web Browser Event type page (a description of each event type is given later in the *Email Alarm Events setting* subsection).
2. **Configuring Email Settings**
   To configure IKS-6726-8PoE's email setup from the serial, Telnet, or web console, enter your Mail Server IP/Name (IP address or name), Account Name, Account Password, Retype New Password, and the email address to which warning messages will be sent.
3. **Activate your settings and if necessary, test the email**
   After configuring and activating your IKS-6726-8PoE's Event Types and Email Setup, you can use the **Test Email** function to see if your e-mail addresses and mail server address have been properly configured.

Event Type



Event Types can be divided into two basic groups: **System Events** and **Port Events**. System Events are related to the overall function of the switch, whereas Port Events are related to the activity of a specific port.

System Events	Warning e-mail is sent when…
Switch Cold Start	Power is cut off and then reconnected.

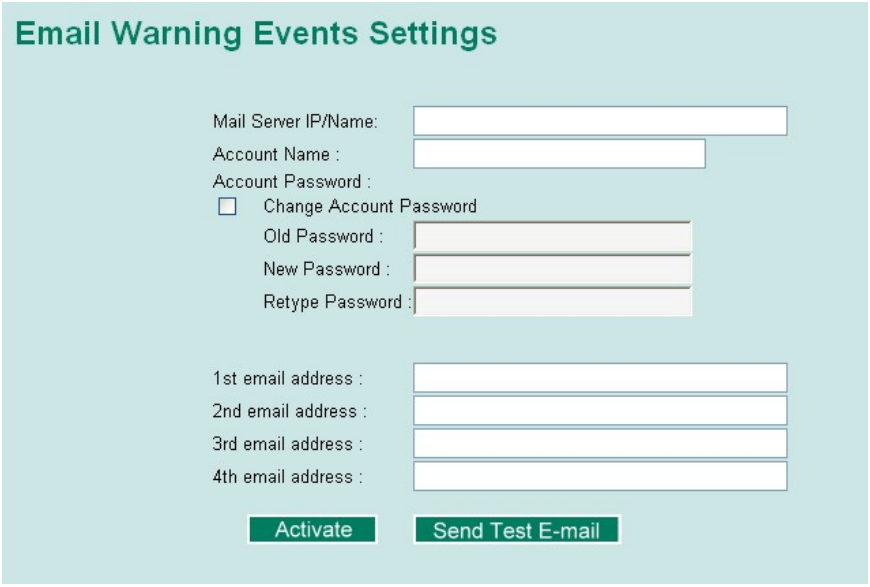
Switch Warm Start	IKS-6726-8PoE is rebooted, such as when network parameters are changed (IP address, subnet mask, etc.).
Power Transition (On→Off)	IKS-6726-8PoE is powered down.
Power Transition (Off→On)	IKS-6726-8PoE is powered up.
Configuration Change Activated	Any configuration item has been changed.
Authentication Failure	An incorrect password is entered.
Comm. Redundancy Topology Changed	If any Spanning Tree Protocol switches have changed their position (applies only to the root of the tree). If the Master of the Turbo Ring has changed or the backup path is activated.

Port Events	**Warning e-mail is sent when…**
Link-ON	The port is connected to another device.
Link-OFF	The port is disconnected (e.g., the cable is pulled out, or the opposing device shuts down).
Traffic-Overload	The port's traffic surpasses the Traffic-Threshold for that port (provided this item is Enabled).
Traffic-Threshold (%)	Enter a nonzero number if the port's Traffic-Overload item is Enabled.
Traffic-Duration (sec.)	A Traffic-Overload warning is sent every Traffic-Duration seconds if the average Traffic-Threshold is surpassed during that time period.

NOTE The Traffic-Overload, Traffic-Threshold (%), and Traffic-Duration (sec.) Port Event items are related. If you Enable the Traffic-Overload event, then be sure to enter a nonzero Traffic-Threshold percentage, as well as a Traffic-Duration between 1 and 300 seconds.

NOTE Warning e-mail messages will have sender given in the form:
Managed-Redundant-Switch-00000@Switch_Location
where Managed-Redundant-Switch-00000 is the default Switch Name, 00000 is IKS-6726-8PoE's serial number, and Switch_Location is the default Server Location.
Refer to the Basic Settings section to see how to modify Switch Name and Switch Location.

Email Setup



Mail Server IP/Name

Setting	Description	Factory Default
IP address	The IP Address of your email server.	None

Account Name

Setting	Description	Factory Default
Max. 45 Charters	Your email account.	None

Password Setting

Setting	Description	Factory Default
Disable/Enable to change password	To reset the password from the Web Browser interface, click the Change password check-box, type the Old password, type the New password, retype the New password, and then click Activate; Max. 45 characters.	Disable
Old password	Type the current password when changing the password	None
New password	Type new password when enabled to change password; Max. 45 characters.	None
Retype password	If you type a new password in the Password field, you will be required to retype the password in the Retype new password field before updating the new password.	None

Email Address

Setting	Description	Factory Default
Max. 30 characters	You can set up to 4 email addresses to receive alarm emails from IKS-6726-8PoE.	None

Send Test Email

After finishing with the email settings, you should first click **Activate** to activate those settings, and then press the **Send Test Email** button to verify that the settings are correct.

NOTE Auto warning e-mail messages will be sent through an authentication protected SMTP server that supports the CRAM-MD5, LOGIN, and PAIN methods of SASL (Simple Authentication and Security Layer) authentication mechanism.
We strongly recommend not entering your Account Name and Account Password if auto warning e-mail messages can be delivered without using an authentication mechanism.

Configuring Relay Warning

The Auto Relay Warning function uses relay output to alert the user when certain user-configured events take place. There are two basic steps required to set up the Relay Warning function:

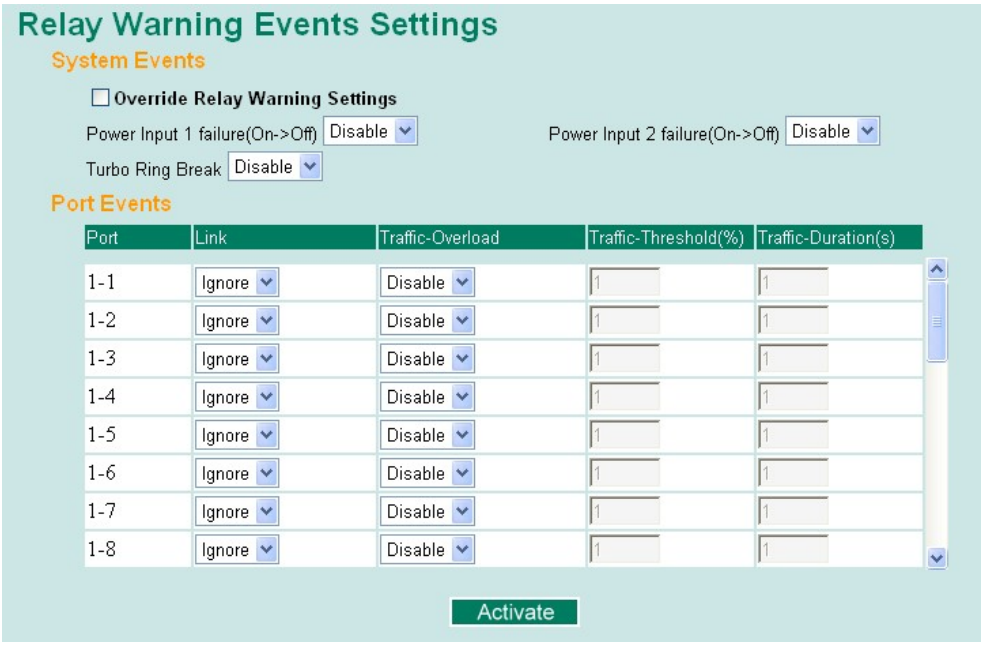
Configuring Relay Event Types

Select the desired **Event types** from the Console or Web Browser Event type page (a description of each event type is given later in the *Relay Alarm Events setting* subsection).

Activate your settings

After completing the configuration procedure, you will need to activate your IKS-6726-8PoE's Relay Event Types.

Event Setup



Event Types can be divided into two basic groups: **System Events** and **Port Events**. System Events are related to the overall function of the switch, whereas Port Events are related to the activity of a specific port.

The IKS-6726-8PoE supports two relay outputs. You can configure which relay output is related to which events. This helps administrators identify the importance of the different events.

System Events	Warning Relay output is triggered when…
Power Transition (On→Off)	IKS-6726-8PoE is powered on.
Power Transition (Off→On)	IKS-6726-8PoE is powered down.

Port Events	Warning e-mail is sent when…
Link-ON	The port is connected to another device.
Link-OFF	The port is disconnected (e.g., the cable is pulled out, or the opposing device shuts down).
Traffic-Overload	The port's traffic surpasses the Traffic-Threshold for that port (provided this item is Enabled).
Traffic-Threshold (%)	Enter a nonzero number if the port's Traffic-Overload item is Enabled.
Traffic-Duration (sec.)	A Traffic-Overload warning is sent every Traffic-Duration seconds if the average Traffic-Threshold is surpassed during that time period.

NOTE The Traffic-Overload, Traffic-Threshold (%), and Traffic-Duration (sec) Port Event items are related. If you Enable the Traffic-Overload event, then be sure to enter a nonzero Traffic-Threshold percentage, as well as a Traffic-Duration between 1 and 300 seconds.

Override relay alarm settings

Click the checkbox to override the relay warning setting temporarily. Releasing the relay output will allow administrators to fix any problems with the warning condition.

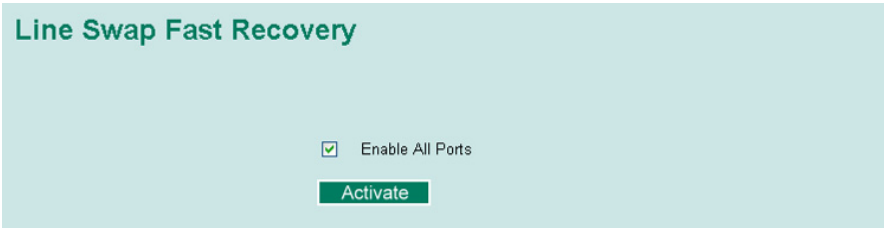
Warning List

Use this table to see if any relay alarms have been issued.

Using Line-Swap-Fast-Recovery

The Line-Swap Fast Recovery function, which is enabled by default, allows IKS-6726-8PoE to return to normal operation extremely quickly after devices are unplugged and then re-plugged into different ports. The recovery time is on the order of a few milliseconds (compare this with standard commercial switches for which the recovery time could be on the order of several minutes). To disable the Line-Swap Fast Recovery function, or to re-enable the function after it has already been disabled, access either the Console utility's **Line-Swap recovery** page, or the Web Browser interface's **Line-Swap fast recovery** page, as shown below.

Configuring Line-Swap Fast Recovery



Enable Line-Swap-Fast-Recovery

Setting	Description	Factory Default
Enable/Disable	Check-mark the check box to enable the Line-Swap-Fast-Recovery function	Enable

Using Set Device IP

To reduce the effort required to set up IP addresses, the IKS-6726-8PoE comes equipped with DHCP/BootP server and RARP protocol to set up IP addresses of Ethernet-enabled devices automatically.

When enabled, the **Set device IP** function allows IKS-6726-8PoE to assign specific IP addresses automatically to connected devices that are equipped with *DHCP Client* or *RARP* protocol. In effect, IKS-6726-8PoE acts as a DHCP server by assigning a connected device with a specific IP address stored in its internal memory. Each time the connected device is switched on or rebooted, IKS-6726-8PoE sends the device the desired IP address.

Take the following steps to use the **Set device IP** function:

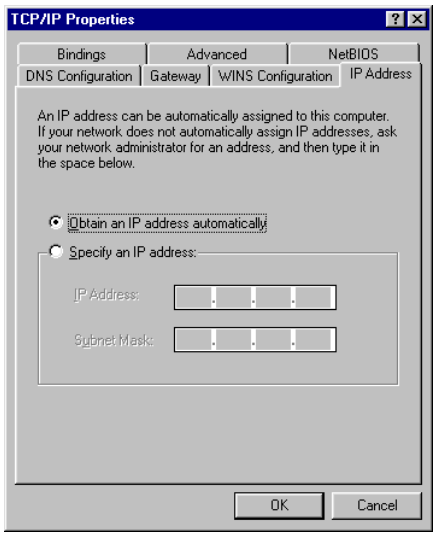
STEP 1—Set up the connected devices

Set up those Ethernet-enabled devices connected to IKS-6726-8PoE for which you would like IP addresses to be assigned automatically. The devices must be configured to *obtain* their IP address automatically.

The devices' configuration utility should include a setup page that allows you to choose an option similar to **Obtain an IP address automatically**.

For example, Windows' **TCP/IP Properties** window is shown at the right. Although your device's configuration utility may look quite a bit different, this figure should give you some idea of what to look for.

You also need to decide which of IKS-6726-8PoE's ports your Ethernet-enabled devices will be connected to. You will need to set up each of these ports separately, as described in the following step.



STEP 2

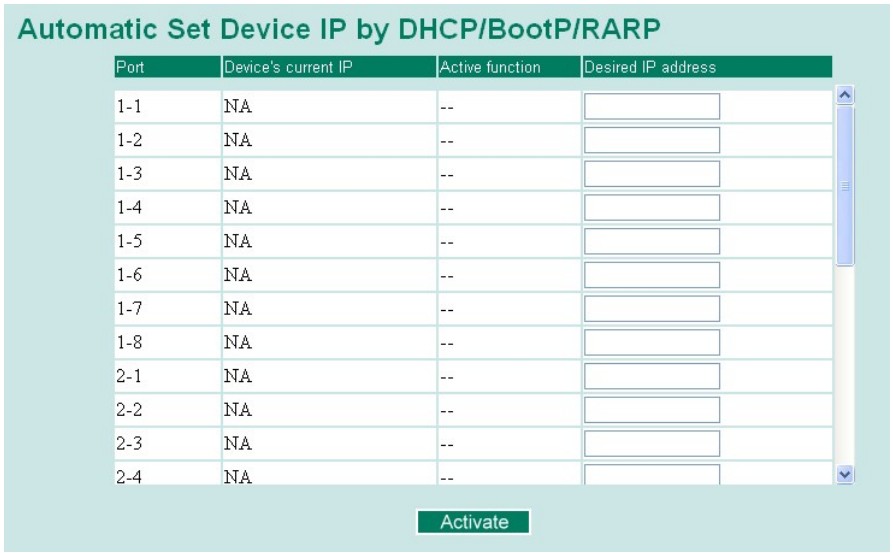
Configure IKS-6726-8PoE's **Set device IP** function, either from the Console utility or from the Web Browser interface. In either case, you simply need to enter the **Desired IP** for each port that needs to be configured.

STEP 3

Be sure to activate your settings before exiting.

- When using the Web Browser interface, activate by clicking on the Activate button.
- When using the Console utility, activate by first highlighting the **Activate** menu option, and then press **Enter**. You should receive the **Set device IP settings are now active! (Press any key to continue)** message.

Configuring Set Device IP



Desired IP Address

Setting	Description	Factory Default
IP Address	Set the desired IP of connected devices.	None

DHCP Option 82

Option 82 is used by the relay agent to insert additional information into the client's DHCP request. The Relay Agent Information option is inserted by the DHCP relay agent when forwarding client-originated DHCP packets to a DHCP server. Servers can recognize the Relay Agent Information option and use the information to implement IP addresses to Clients.

When Option 82 is enabled on the switch, a subscriber device is identified by the switch port through which it connects to the network (in addition to its MAC address). Multiple hosts on the subscriber LAN can be connected to the same port on the access switch and are uniquely identified.

The Option 82 information contains 2 sub-options: Circuit ID and Remote ID, which define the relationship between end device IP and the DHCP Option 82 server. The "Circuit ID" is a 4-byte number generated by the Ethernet switch—a combination of physical port number and VLAN ID. The format of the "Circuit ID" is as described below:

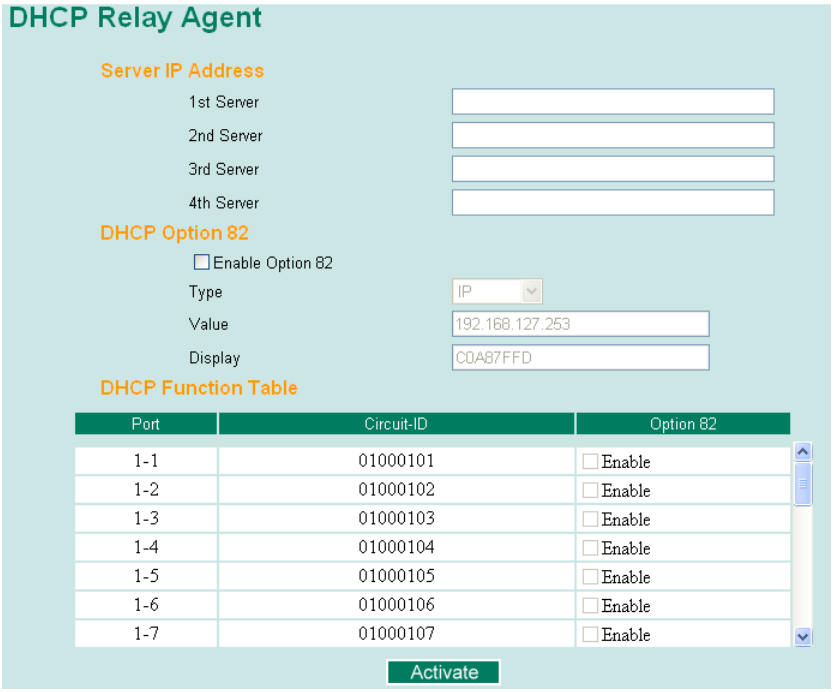
FF–VV–VV–PP

This is where the first byte "FF" is fixed to "01", the second and the third byte "VV-VV" is formed by the port VLAN ID in hex, and the last byte "PP" is formed by the port number in hex. For example:

01–00–0F–03 is the "Circuit ID" of port number 3 with port VLAN ID 15.

The "Remote ID" is to identify the relay agent itself and it can be one of the following:

1. The IP address of the relay agent.
2. The MAC address of the relay agent.
3. A combination of IP address and MAC address of the relay agent.
4. A user-defined string.



Server IP Address

1st Server

Setting	Description	Factory Default
IP address for the 1st DHCP server	This assigns the IP address of the 1st DHCP server that the switch tries to access.	None

2nd Server

Setting	Description	Factory Default
IP address for the 2nd DHCP server	This assigns the IP address of the 2nd DHCP server that the switch tries to access.	None

3rd Server

Setting	Description	Factory Default
IP address for the 3rd DHCP server	This assigns the IP address of the 3rd DHCP server that the switch tries to access.	None

4th Server

Setting	Description	Factory Default
IP address for the 4th DHCP server	This assigns the IP address of the 4th DHCP server that the switch tries to access.	None

DHCP Option 82

Enable Option82

Setting	Description	Factory Default
Enable or Disable	Enable or disable DHCP Option 82 function.	Disable

Type

Setting	Description	Factory Default
IP	Use switch IP address as the remote ID sub-option.	IP
MAC	Use switch MAC address as the remote ID sub-option.	IP
Client-ID	Use the combination of switch MAC address and IP address as the remote ID sub-option.	IP
Other	Use the user-defined value as the remote ID sub-option.	IP

Value

Setting	Description	Factory Default
	Displays the value which you've set.	
Max. 12 characters	If you set the type as Other, you will have to fill it.	switch IP address

Display

Setting	Description	Factory Default
	The actual hexdecimal value set at the DHCP server for the Remote-ID. This value is automatically generated according to the Value field. Users can not modify it.	COA87FFD

DHCP Function Table

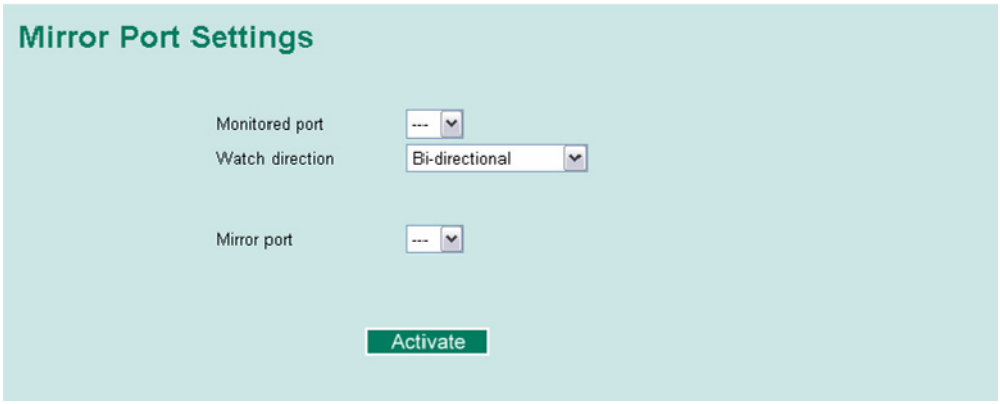
Enable

Setting	Description	Factory Default
Enable or Disable	Enable or disable DHCP Option 82 function for this port.	Disable

Using Diagnosis

The IKS-6726-8PoE provides two important tools for administrators to diagnose network systems.

Mirror Port



The **Mirror port** function can be used to monitor data being transmitted through a specific port. This is done by setting up another port (the *mirror port*) to receive the same data being transmitted from, or both to and from, the port under observation. This allows the network administrator to **sniff** the observed port and thus keep tabs on network activity.

Take the following steps to set up the **Mirror Port** function:

STEP 1

Configure IKS-6726-8PoE's **Mirror Port** function from either the Console utility or Web Browser interface. You will need to configure three settings:

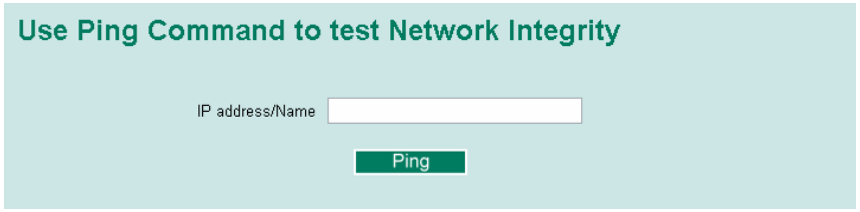
Monitored Port	Select the port number of the port whose network activity will be monitored.
Mirror Port	Select the port number of the port that will be used to monitor the activity of the monitored port.
Watch Direction	Select one of the following two watch direction options: • **Input data stream** Select this option to monitor only those data packets coming into the IKS-6726-8PoE's port. • **Output data stream** Select this option to monitor only those data packets being sent out through IKS-6726-8PoE's port. • **Bi-directional** Select this option to monitor data packets both coming into, and being sent out through, IKS-6726-8PoE's port.

STEP 2

Be sure to activate your settings before exiting.

- When using the Web Browser interface, activate by clicking on the **Activate** button.
- When using the Console utility, activate by first highlighting the Activate menu option, and then press **Enter**. You should receive the **Mirror port settings are now active! (Press any key to continue)** message.

Ping

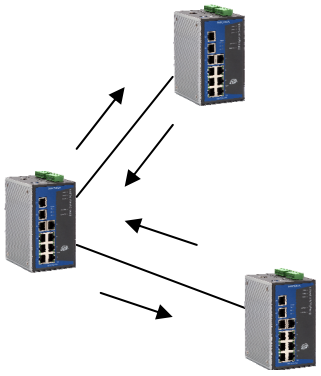


The **Ping** function uses the *ping* command to give users a simple but powerful tool for troubleshooting network problems. The function's most unique feature is that even though the ping command is entered from the user's PC keyboard, the actual ping command originates from IKS-6726-8PoE itself. In this way, the user can essentially sit on top of IKS-6726-8PoE and send ping commands out through its ports.

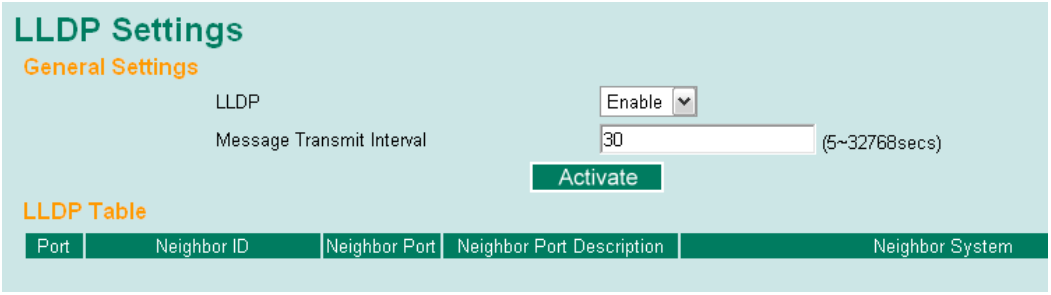
To use the Ping function, type in the desired IP address, and then press **Enter** from the Console utility, or click **Ping** when using the Web Browser interface.

LLDP Function Overview

Defined by IEEE 802.11AB, LLDP is an OSI Layer 2 Protocol that standardizes the methodology of self-identity advertisement. It allows each networking device, e.g. a Moxa managed switch, to periodically inform its neighbors about its self-information and configurations. As a result, all of the devices would have knowledge about each other; and through SNMP, this knowledge can be transferred to Moxa's MXview for auto-topology and network visualization.



LLDP Web Interface



From the switch's web interface, users have the option of either enabling or disabling the LLDP, as well as setting the LLDP transmit interval (as shown in the figure below). In addition, users are able to view each switch's neighbor-list, which is reported by its network neighbors. Most importantly, enabling the LLDP function allows Moxa's MXview to automatically display the network's topology as well as system setup details such asVLAN, and Trunking for the entire network.

LLDP Settings

Enable LLDP

Setting	Description	Factory Default
Enable or Disable	Enable or disable LLDP function.	Enable

Value

Setting	Description	Factory Default
Numbers from 5 to 32768 secs	To set the transmit interval of LLDP messages. Unit is in seconds.	30 (seconds)

LLDP Table

Port	Neighbor ID	Neighbor Port	Neighbor Port Description	Neighbor System

Port: The port number that connects to the neighbor device.

Neighbor ID: A unique entity which identifies a neighbor device; this is typically the MAC address.

Neighbor Port: The port number of the neighbor device.

Neighbor Port Description: A textual description of the neighbor device's interface.

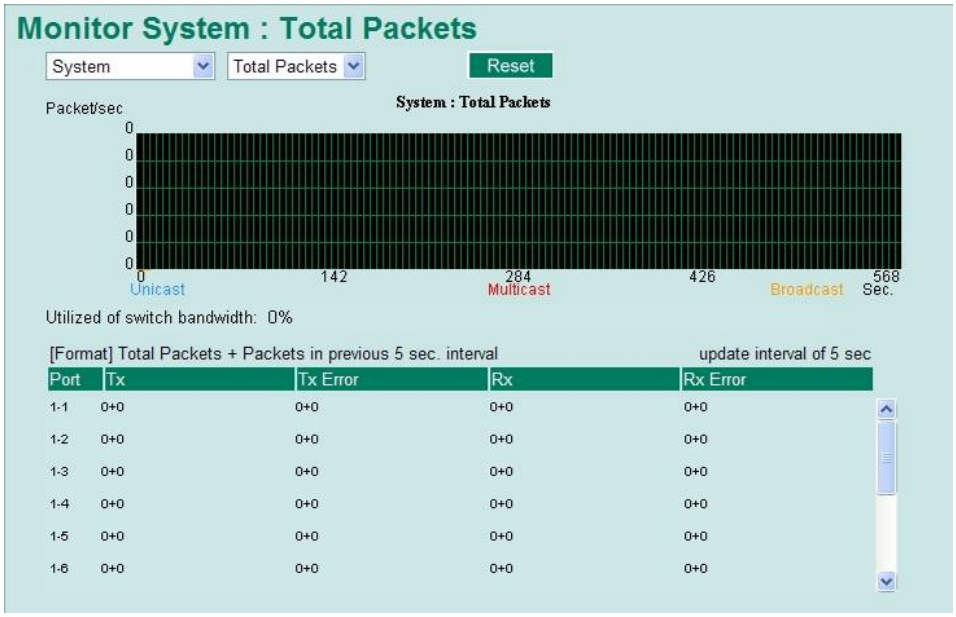
Neighbor System: Hostname of the neighbor device.

Using Monitor

You can monitor statistics in real time from IKS-6726-8PoE's web console and serial console.

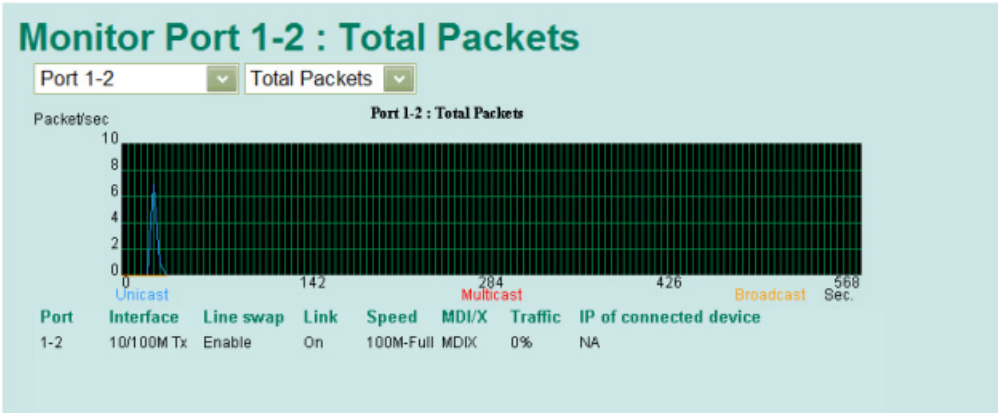
Monitor by Switch

Access the Monitor by selecting **System** from the left selection bar. Monitor by System allows the user to view a graph that shows the combined data transmission activity of all of IKS-6726-8PoE's 18 ports. Click one of the four options—**Total Packets**, **TX Packets**, **RX Packets**, or **Error Packets**—to view transmission activity of specific types of packets. Recall that TX Packets are packets sent out from IKS-6726-8PoE, RX Packets are packets received from connected devices, and Error Packets are packets that did not pass TCP/IP's error checking algorithm. The Total Packets option displays a graph that combines TX, RX, and TX Error, RX Error Packets activity. The graph displays data transmission activity by showing **Packets/s** (i.e., packets per second, or pps) versus **sec.** (seconds). In fact, three curves are displayed on the same graph: **Uni-cast** packets (in red color), **Multi-cast** packets (in green color), and **Broad-cast** packets (in blue color). The graph is updated every few seconds, allowing the user to analyze data transmission activity in real-time.



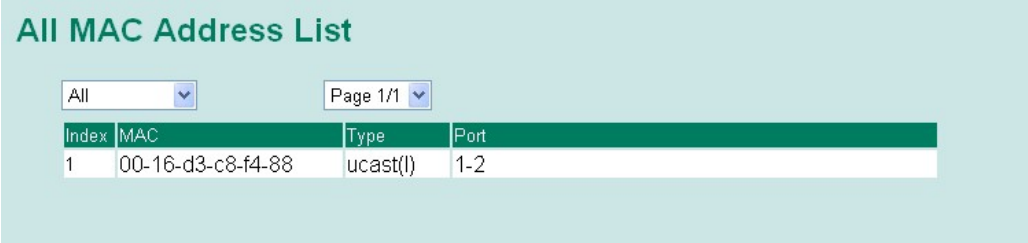
Monitor by Port

Access the Monitor by Port function by selecting **ALL 10/100M or 1G Ports** or **Port *i***, in which ***i*= 1, 2, ..., G2**, from the left pull-down list. The **Port *i*** options are identical to the Monitor by System function discussed above, in that users can view graphs that show All Packets, TX Packets, RX Packets, or Error Packets activity, but in this case, only for an individual port. The **All Ports** option is essentially a graphical display of the individual port activity that can be viewed with the Console Monitor function discussed above. The All Ports option shows three vertical bars for each port. The height of the bar represents **Packets/s** for the type of packet, at the instant the bar is being viewed. That is, as time progresses, the height of the bar moves up or down so that the user can view the change in the rate of packet transmission. The blue colored bar shows **Uni-cast** packets, the red colored bar shows **Multi-cast** packets, and the orange colored bar shows **Broad-cast** packets. The graph is updated every few seconds, allowing the user to analyze data transmission activity in real-time.



Using the MAC Address Table

This section explains the information provided by IKS-6726-8PoE's MAC address table.



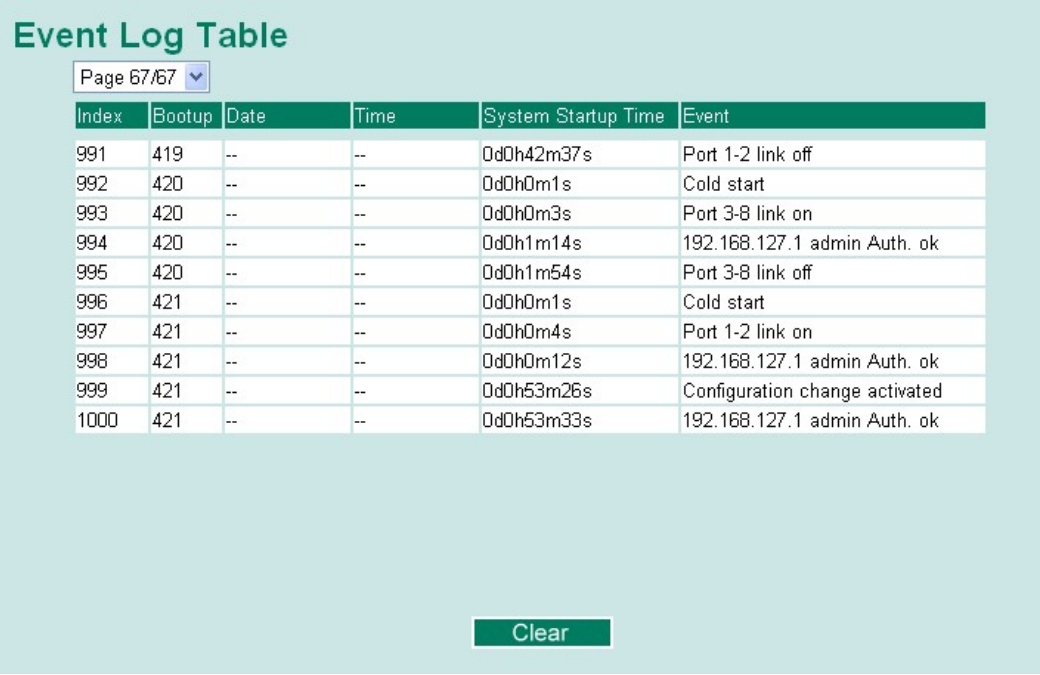
The MAC Address table can be configured to display the following IKS-6726-8PoE MAC address groups.

ALL	Select this item to show all IKS-6726-8PoE MAC addresses
ALL Learned	Select this item to show all IKS-6726-8PoE Learned MAC addresses
ALL Static Lock	Select this item to show all IKS-6726-8PoE Static Lock MAC addresses
ALL Static	Select this item to show all IKS-6726-8PoE Static/Static Lock /Static Multicast MAC addresses
ALL Static Multicast	Select this item to show all IKS-6726-8PoE Static Multicast MAC addresses
Port x	Select this item to show all MAC addresses of dedicated ports

The table will display the following information:

MAC	This field shows the MAC address
Type	This field shows the type of this MAC address
Port	This field shows the port that this MAC address belongs to

Using Event Log



Bootup	This field shows how many times the IKS-6726-8PoE has been rebooted or cold started.
Date	The date is updated based on how the current date is set in the Basic Setting page.
Time	The time is updated based on how the current time is set in the Basic Setting page.
System Startup Time	The system startup time related to this event.
Events	Events that have occurred.

NOTE The following events will be record into IKS-6726-8PoE's Event Log Table.

- Cold start
- Warm start
- Configuration change activated
- Power 1/2 transition (Off (On), Power 1/2 transition (On (Off)
- Authentication fail
- Topology changed
- Master setting is mismatched
- Port traffic overload
- dot1x Auth Fail
- Port link off / on

Using Syslog

This function provides the event logs for the syslog server. The function supports 3 configurable syslog servers and syslog server UDP port numbers. When an event occurs, the event will be sent as a syslog UDP packet to the specified syslog servers.

Syslog Server 1

Setting	Description	Factory Default
IP Address	Enter the IP address of 1st Syslog server used by your network.	None
Port Destination (1 to 65535)	Enter the UDP port of 1st Syslog server.	514

Syslog Server 2

Setting	Description	Factory Default
IP Address	Enter the IP address of 2nd Syslog server used by your network.	None
Port Destination (1 to 65535)	Enter the UDP port of 2nd Syslog server.	514

Syslog Server 3

Setting	Description	Factory Default
IP Address	Enter the IP address of 3rd Syslog server used by your network.	None
Port Destination (1 to 65535)	Enter the UDP port of 3rd Syslog server.	514

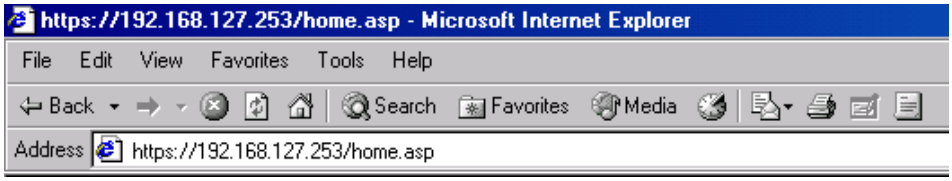
NOTE The following events will be recorded into the IKS-6726-8PoE's Event Log table, and will then be sent to the specified Syslog Server:

- Cold start
- Warm start
- Configuration change activated
- Power 1/2 transition (Off (On), Power 1/2 transition (On (Off)
- Authentication fail
- Topology changed
- Master setting is mismatched
- Port traffic overload
- dot1x Auth Fail
- Port link off / on

Using HTTPS/SSL

To secure your HTTP access, the IKS-6726-8PoE supports HTTPS/SSL to encrypt all HTTP traffic. Perform the following steps to access the IKS-6726-8PoE's web browser interface via HTTPS/SSL.

1. Open Internet Explorer and type **https:// IKS-6726-8PoE's IP address** in the address field. Press Enter to establish the connection.



2. Warning messages will pop up to warn the user that the security certificate was issued by a company they have not chosen to trust.

3. Select **Yes** to enter the IKS-6726-8PoE's web browser interface and access the web browser interface secured via HTTPS/SSL.

NOTE Moxa provides a Root CA certificate .After installing this certificate into your PC or notebook, you can access the web browser interface directly and will not see any warning messages again. You may download the certificate from the IKS-6726-8PoE's CD-ROM.

A

MIB Groups

The IKS-6726-8PoE comes with built-in SNMP (Simple Network Management Protocol) agent software that supports cold/warm start trap, line up/down trap, and RFC 1213 MIB-II.

The standard MIB groups that the IKS-6726-8PoE supports are as follows:

MIB II.1 – System Group
- sysORTable

MIB II.2 – Interfaces Group
- ifTable

MIB II.4 – IP Group
- ipAddrTable
- ipNetToMediaTable
- IpGroup
- IpBasicStatsGroup
- IpStatsGroup

MIB II.5 – ICMP Group
- IcmpGroup
- IcmpInputStatus
- IcmpOutputStats

MIB II.6 – TCP Group
- tcpConnTable
- TcpGroup
- TcpStats

MIB II.7 – UDP Group
- udpTable
- UdpStats

MIB II.10 – Transmission Group
- dot3
- dot3StatsTable

MIB II.11 – SNMP Group
- SnmpBasicGroup
- SnmpInputStats
- SnmpOutputStats

MIB II.17 – dot1dBridge Group
- dot1dBase
  - dot1dBasePortTable
- dot1dStp
  - dot1dStpPortTable
- dot1dTp
  - dot1dTpFdbTable
  - dot1dTpPortTable
  - dot1dTpHCPortTable

dot1dTpPortOverflowTable
pBridgeMIB
dot1dExtBase
dot1dPriority
dot1dGarp
qBridgeMIB
dot1qBase
dot1qTp
dot1qFdbTable
dot1qTpPortTable
dot1qTpGroupTable
dot1qForwardUnregisteredTable
dot1qStatic
dot1qStaticUnicastTable
dot1qStaticMulticastTable
dot1qVlan
dot1qVlanCurrentTable
dot1qVlanStaticTable
dot1qPortVlanTable

The IKS-6726-8PoE also provides a private MIB file, located in the file **Moxa-IKS-6726-8PoE-MIB.my** on the IKS-6726-8PoE utility CD-ROM.

Public Traps

- Cold Start
- Link Up
- Link Down
- Authentication Failure
- dot1dBridge New Root
- dot1dBridge Topology Changed

Private Traps

- Configuration Changed
- Power On
- Power Off
- Traffic Overloaded
- Turbo Ring Topology Changed
- Turbo Ring Coupling Port Changed
- Turbo Ring Master Mismatch
