About Moxa

Moxa is a leading provider of edge connectivity, industrial computing, and network infrastructure solutions for enabling connectivity for the Industrial Internet of Things. With over 35 years of industry experience, Moxa has connected more than 111 million devices worldwide and has a distribution and service network that reaches customers in more than 91 countries. Moxa delivers lasting business value by empowering industry with reliable networks and sincere service for industrial communications infrastructures. Information about Moxa's solutions is available at www.moxa.com.

MOXA®

1 Introduction

This document provides guidelines on how to configure and secure the NPort 6000 Series. Consider the recommended steps in this document as best practices for security in most applications. We highly recommend that you review and test the configurations thoroughly before implementing them in your production system to ensure that your application is not negatively affected.

2 General System Information

2.1 Basic Information About the Device

Model	Function	Operating System	Firmware Version
NPort 6000 Series	Device server	Moxa Operating System	Version 2.3

The NPort 6000 Series is a device server specifically designed to allow industrial devices to be accessible directly from a network. Thus, legacy devices can be transformed into Ethernet devices, which then can be monitored and controlled from any network location or even the Internet. Different configurations and features are available for specific applications, such as protocol conversion, Real COM drivers, and TCP operation modes, to name a few. The series uses TLS protocols to transmit encrypted serial data over Ethernet.

Moxa Operating System (MOS) is an embedded proprietary operating system that is used only in Moxa edge devices. Because the MOS operating system is not freely available, the chances of malware attacks are significantly reduced.

2.2 Deployment of the Device

Deploy the NPort 6000 Series behind a secure firewall network that has sufficient security features in place to ensure that networks are safe from internal and external threats.

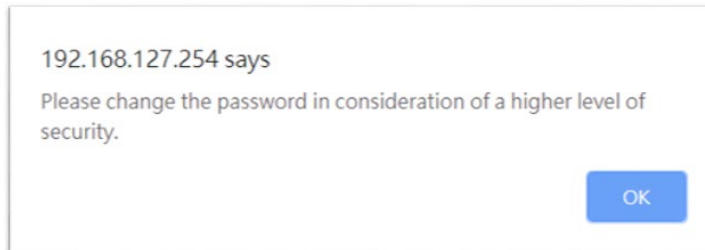

Make sure that the physical protection of the NPort devices and/or the system meets the security needs of your application. By limiting physical access to authorized personnel, you significantly reduce the risk of local cyberattacks. Depending on the environment and the threat situation, the form of protection can vary significantly.

3 Configuration and Hardening Information

For security reasons, account and password protection is enabled by default, so you must provide the correct account and password to unlock the device before entering the web console of the gateway.

The default account and password are **admin** and **moxa** (both in lowercase letters), respectively. Once you are successfully logged in, a pop-up notification will appear to remind you to change the password to ensure a higher level of security.

From firmware version 2.0, there is no default username or password. Create a username and password immediately before logging in for the first time to enhance the security of your device.

Moxa

First boot

Username :

New Password : (4-16 characters)

Confirm Password : (4-16 characters)

3.1 TCP/UDP Ports and Recommended Services

Refer to the table below for all the ports, protocols, and services that are used to communicate between the NPort 6000 Series and other devices.

Service Name	Option	Default Settings	Type	Port Number	Description
Moxa Command (DSCI)	Enable/Disable	Enable	TCP	14900, 4900	For Moxa utility communication
			UDP	4800	
DNS_wins	Enable	Enable	UDP	53, 137, 949	Processing DNS and WINS (Client) data
SNMP agent	Enable/Disable	Disable	UDP	161	SNMP handling routine
RIPD_PORT	Enable/Disable	Disable	UDP	520, 521	Processing RIP routing data
HTTP server	Redirect to HTTPS/Disable	Disable	TCP	80	Web console
HTTPS server	Enable/Disable	Enable	TCP	443	Secured web console
SSH	Enable/Disable	Enable	TCP	22	SSH console
Telnet server	Enable/Disable	Disable	TCP	23	Telnet console
RADIUS	Enable/Disable	Disable	UDP	User-defined (1645 as default or 1812)	Authentication server
TACACS+	Enable/Disable	Disable	TCP	49	Authentication server
DHCP client	Enable/Disable	Disable	UDP	68	The DHCP client needs to acquire the system IP address from the server
SNTP	Enable/Disable	Disable	UDP	Random port	Synchronize time settings with a time server
Remote System Log	Enable/Disable	Disable	UDP	Random port	Send the event log to a remote log server

Operation Mode	Option	Default Settings	Type	Port Number
Real COM Mode	Enable/Disable	Enable	TCP	950+ (Serial port No. -1) 966+ (Serial port No. -1)
RFC2217 Mode	Enable/Disable	Disable	TCP	User-defined (default: 4000+Serial port No.)
TCP Server Mode	Enable/Disable	Disable	TCP	User-defined (default: 4000+Serial Port No.) User-defined (default: 966+Serial Port No.)
UDP Mode	Enable/Disable	Disable	UDP	User-defined (default: 4000+Serial Port No.)
Pair Connection Slave Mode	Enable/Disable	Disable	TCP	User-defined (default: 4000+Serial Port No.)
Ethernet Modem Mode	Enable/Disable	Disable	TCP	User-defined (default: 4000+Serial Port No.)
Reverse Telnet Mode	Enable/Disable	Disable	TCP	User-defined (default: 4000+Serial Port No.)
Reverse SSH Mode	Enable/Disable	Disable	TCP	User-defined (default: 4000+Serial Port No.)
Printer RAW Mode	Enable/Disable	Disable	TCP	2048+(Group No. -1)
Printer LPD Mode	Enable/Disable	Disable	TCP	515
Disabled Mode	Enable/Disable	Disable	N/A	N/A

For security reasons, consider disabling unused services. After the initial setup, use services with stronger security for data communication. Refer to the table below for the suggested settings.

Service Name	Suggested Settings	Type	Port Number	Security Remark
Moxa Command (DSCI)	Disable	TCP	14900, 4900	Disable this service as it is not commonly used
		UDP	4800	
DNS_wins	Enable	UDP	53, 137, 949	A necessary service to get IP; cannot be disabled
SNMP	Disable	UDP	161	We suggest you manage the NPort via the HTTPS console
RIPD_PORT	Disable	UDP	520, 521	Since the NPort is not a router or Layer 3 switch, you may not need this service
HTTP Server	Disable	TCP	80	Disable HTTP to prevent plain-text transmission
HTTPS Server	Enable	TCP	443	Encrypted data channel with a trusted certificate for NPort configurations
SSH	Disable	TCP	22	Disable the service if remote access to the device is not needed for configuration
Telnet Server	Disable	TCP	23	Disable services that are not commonly used
RADIUS	Enable	UDP	User Define (1645 as default or 1812)	If you are using the central account management feature (has a RADIUS server), you may enable this service.
TACACS+	Enable	TCP	49	If you are using the central account management feature (has a TACACS+ server), you may enable this service. Select either RADIUS or TACACS+ to be the central account management service and disable the other one.
DHCP Client	Disable	UDP	67, 68	Assign an IP address manually for the device
SNTP Client	Disable	UDP	Random Port	We suggest you use the SNTP server for secure time synchronization
Remote System Log	Enable	UDP	Random port	We suggest using a system log server to store all the logs from all the devices on the network

To enable or disable these services, log in to the HTTP/HTTPS console and select **Administration > Console Settings**.

Console Settings

HTTP console	☒ Redirect to HTTPS ☐ Disable
HTTPS console (support TLS v1.2)	☒ Enable ☐ Disable
TLS v1.0/v1.1 for HTTPS console	☐ Enable ☒ Disable
Reject an unrecognized host header	☒ Enable ☐ Disable
Telnet console	☐ Enable ☒ Disable
SSH console	☒ Enable ☐ Disable
Moxa Service	☒ Enable ☐ Disable
Sensitive Data Encryption	MD5/AES128 ▼
Maximum Login Users For HTTP+HTTPS	10 (1~10)
Auto Logout Setting (min)	5 (1~1440)
Console authentication type	Local ▼
Try next type on authentication denied	☐ Enable ☒ Disable
Reset button	☒ Always Enable ☐ Disable after 60 sec

Submit

To disable the SNMP agent service, log in to the HTTPS console and select **Administration > SNMP Agent**, then select **Disable** for SNMP.

SNMP Agent Settings

Configuration	
SNMP	☒ Enable ☐ Disable
Read community string	 (max: 31 characters)
Write community string	 (max: 31 characters)

End Date	-- ▾	-- ▾	-- ▾	-- ▾
Offset	0 ▾ hour(s)			

For the remote system log server, it depends on your network architecture. We recommend that your network administrator have a log server to receive the log messages from the device. Here, log in to the HTTP/HTTPS/SSH/Telnet console, select **Remote Log Server**, and input the IP address of the Log Server in the **SYSLOG server** field. If your network doesn't have one, keep it empty (disable **Remote System Log Server**).

Remote Log Server

Configuration	
SYSLOG server	
SYSLOG facility	local use 0 ▾
SYSLOG severity	Emergency ▾

For the operation mode services, it depends on how you bring your serial device to the Ethernet network. For example, if your host PC uses legacy software to open a COM port to communicate with the serial device, then the NPort will enable the Real COM mode for this application. If you don't want the NPort to provide such a service, log in to the HTTP/HTTPS/SSH/Telnet console, select **Serial Port Settings > Port # > Operation Modes**, and then select **Disable**.

Operation Modes

☐ P2

☐ All ports

Submit

Note For each instruction above, click the Submit button to save your changes, then restart the NPort device so the new settings will take effect.

3.2 HTTPS and SSL Certificates

HTTPS is an encrypted communication channel. As TLS v1.1 or lower has severe vulnerabilities that can easily be hacked, the NPort 6000 Series uses TLS v1.2 for HTTPS to ensure data transmissions are secured. Make sure your browser has TLS v1.2 enabled.

To be backward compatible with the most popular and different browsers, the NPort 6000 Series will support most of the encryption algorithms that TLS v1.2 supports. If you are concerned that some of them are weak ciphers, you may select **System Configuration > Secure Connection Settings > Ethernet SSL/TLS Certificate**. Then, you can enable the **High secure mode**, which will make the NPort 6000 Series use only the strong ciphers.

SSL/TLS Configuration

High secure mode

☐ Enable ☒ Disable

Submit

To use the HTTPS console without a certificate warning appearing, you need to import a trusted certificate issued by a third-party certificate authority.

Log in to the HTTP/HTTPS console and select **System Management > Certificate**. Generate an up-to-date valid certificate by importing a third-party trusted SSL certificate or generating the “NPort self-signed” certificate.

- Behavior of SSL certificate on an NPort 6000 device
 - NPort devices can auto-generate a self-signed SSL certificate. It is recommended that you import SSL certificates that are certified by a trusted third-party Certificate Authority (CA) or by an organization's CA.
 - The length of the NPort device's self-signed private keys is 256 bits, which should be compatible with most applications. Some applications may need a longer key, which would require importing a third-party certificate. Note that longer keys will mean browsing the web console will be slower because of the increased complexity of encrypting and decrypting communicated data.
- For the NPort self-signed certificate:

If a certificate has expired, you can regenerate the NPort self-signed certificate with the following steps.

 - Step 1. **Delete** the current SSL certificate issued by the NPort device.
 - Step 2. **Enable** the NTP server and set up the time zone and local time.
 - Step 3. After restarting the device, the NPort self-signed certificate will be regenerated with a new expiration date.

- Importing the third-party trusted SSL certificate:

By importing the third-party trusted SSL certificate, the security level can be enhanced. A snapshot of the GUI for the web console is shown below. To generate the SSL certificate through the third party, here are the steps:

- Step 1. Create a certification authority (Root CA), such as Microsoft AD Certificate Service (<https://mizitechinfo.wordpress.com/2014/07/19/step-by-step-installing-certificate-authority-on-windows-server-2012-r2/>)
- Step 2. Find a tool to issue a certificate signing request (CSR) file. You can get one from a third-party CA company such as DigiCert (<https://www.digicert.com/easy-csr/openssl.htm>).
- Step 3. Submit the CSR file to a public certification authority to get a signed certificate.
- Step 4. Import the certificate to the NPort device. Please note that NPort devices only accept certificates using a **".pem"** format.

Note The maximum supported key length of the NPort devices is 4,096 bits.

- Some well-known third-party CA (Certificate Authority) companies for your reference (https://en.wikipedia.org/wiki/Certificate_authority):
 - IdenTrust (<https://www.identrust.com/>)
 - DigiCert (<https://www.digicert.com/>)
 - Comodo Cybersecurity (<https://www.comodo.com/>)
 - GoDaddy (<https://www.godaddy.com/>)
 - Verisign (<https://www.verisign.com/>)

3.3 Account Management

- The NPort 6000 Series provides two different user levels, administrator and user. With a read-write account, you can access and change all settings through the web console. With a user account, you can only view settings.
- The default administrator account is **admin**, and the default password is **moxa**. Starting from firmware version 2.0, you need to set the administrator's account and password before you log in for the first time. To manage accounts, log in to the web console and select **Administration > Account Management > User Account**. To change the password of an existing account, click on the account name and select **Edit** in the top toolbar. Input the old password in the **Password** field and the new password in the **Confirm Password** field to change the password.
- Through the administration account, admin, log in to NPort 6000 Series and perform the configuration settings. To change the default password (moxa), log in to the HTTPS/SSH/Telnet console and select **System Management > Account Management > User Account**. For the **Password** part, input the old password and the new password twice (at least 4 characters) to change the password.

Cancel

Note We suggest you manage your device with another “administrator level” account instead of using the default “admin” account, as embedded systems commonly used it. Once the new administrator-level account has been created, the original “admin” account should be monitored for security reasons to prevent brute-force attacks.

1. No Display: The user in this user group will not see this function group when accessing the NPort 6000.
2. Read Only: The user in this user group can only view the function/setting in this function group but cannot make changes.
3. Read Write: The user in this user group can view the function/setting in this function group and make changes.

Access Permission									
						+ Add	✎ Edit	🗑 Delete	💾 Save
Group Name	Overview	Network Config	Serial Config	System Config	Administration	Log, Monitoring and Warning	Common Settings		
administrator	Read Only	Read Write	Read Write	Read Write	Read Write	Read Write	Read Write		
guest	Read Only	No Display	No Display	No Display	No Display	No Display	No Display		
port_admin	Read Only	No Display	Read Write	Read Write	No Display	Read Write	Read Write		

The function groups in the NPort 6000 are defined according to six sets of functions, including:

1. Network Configuration: Settings in this function group are network-related, for example, setting up IP addresses, route tables, etc.
2. Serial Port Configuration: Settings in this function group are serial port operation-related, such as serial parameters, operation modes, etc.
3. System Configuration: Settings in this function group are device system related, for example, device server name, firmware upgrade, etc.
4. Administration: Settings in this function group are access control related, for example, account management, console settings, etc.
5. Log, Monitoring, and Warning: Settings in this function group are device/communication status related, for example, system log, system monitoring, email alert, etc.
6. Common Settings: Miscellaneous functions

- To improve security, the login password policy and account login failure logout can be configured. To configure them, log in to the HTTP/HTTPS console and select **Administration > Account management > Password & Login Policy**.

Account Password and Login Management

Account Password Policy

Password minimum length	16 (4 - 16)
Password complexity strength check	☒ Enable ☐ Disable
At least one digit (0~9)	☒ Enable ☐ Disable
Mixed upper and lower case letters (A~Z, a~z)	☒ Enable ☐ Disable
At least one special character (~!@#\$%^&*-_!;:,.<>[]{}())	☒ Enable ☐ Disable
Password lifetime	1 (0 - 180 day; 0 for Disable)

Account Login Failure Lockout

Account login failure lockout	☒ Enable ☐ Disable
Retry failure threshold	5 (1 - 10 retry)
Lockout Time	5 (1 - 60 min)

You should adjust the password policy to require more complex passwords. For example, set the **Minimum length** to 16, enable all password complexity strength checks, and enable the **Password lifetime** options. Also, to avoid brute-force attack, it's suggested that you enable the **Account login failure lockout** feature.

- For some system security requirements, a warning message may need to be displayed to all users attempting to log in to the device. To add a login message, log in to the HTTPS console and select **Administration > Account management > Notification Message**, and enter a **Login Message** to use.

Notification Message

Notification Message

Login Message	Welcome to Moxa NPort 21 characters/Maximum 240 characters
Login Authentication Failure Message	Please contact administration if you have forgotten the password. 65 characters/Maximum 240 characters
Submit	

3.4 Accessible IP List

- The NPort 6000 Series has a feature that can limit access to specific remote host IP addresses to prevent unauthorized access. If a host's IP address is in the accessible IP table, then the host will be allowed to access the NPort 6000 Series. To configure it, log in to the HTTPS console and select **System Configuration > Accessible IP List**.

Accessible IP List

- ☐ Activate the accessible IP list (Operation modes are NOT allowed for the IPs NOT on the list)
- ☐ Apply additional restrictions (All device services are NOT allowed for the IPs NOT on the list)

No.	Active	IP Address	Netmask/Prefix
1	☐		
2	☐		
3	☐		
4	☐		
5	☐		
6	☐		

- You may add a specific address or range of addresses by using a combination of an IP address and a netmask as follows:
 - **To allow access to a specific IP address:** Enter the IP address in the corresponding field; enter 255.255.255.255 for the netmask.
 - **To allow access to hosts on a specific subnet:** For both the IP address and netmask, use 0 for the last digit (e.g., "192.168.1.0" and "255.255.255.0").
 - **To allow access to all IP addresses:** Make sure that the **Enable** checkbox for the Accessible IP List is not checked.

Additional configuration examples are shown in the following table:

Desired IP Range	IP Address Field	Netmask Field
Any host	Disable	Enable
192.168.1.120	192.168.1.120	255.255.255.255
192.168.1.1 to 192.168.1.254	192.168.1.0	255.255.255.0
192.168.1.1 to 192.168.255.254	192.168.0.0	255.255.0.0
192.168.1.1 to 192.168.1.126	192.168.1.0	255.255.255.128
192.168.1.129 to 192.168.1.254	192.168.1.128	255.255.255.128

WARNING

Ensure that the IP address of the PC you are using to access the web console is in the **Accessible IP List**.

3.5 Logging and Auditing

- These are the events that the NPort 6000 Series will record:

Event Group	Summary
System	System cold start, System warm start
Network	DHCP/BOOTP gets IP/renew, NTP connect failed, IP conflict, Network link down
Configuration	Login failed, IP changed, Password changed, Firmware upgraded, Certificate imported, Configuration imported or exported, Configuration changed, Clear event logged
OpMode	Connect, Disconnect, Authentication Fail, Restart

- To configure this setting, log in to the HTTPS console and select **Log, Monitoring and Warning > System Log Settings**. Then, enable the **Local Log** for recording on the NPort 6000 device and/or **Remote log** for keeping records on a server. Enable system log settings to record all important system events to monitor device status and check for security issues.

System Log Settings

Event Group	Local Log	Remote Log	Summary
System	☒	☐	System Cold Start, System Warm Start
Network	☒	☐	DHCP/BOOTP/PPPoE Get IP/Renew, NTP, Mail Fail, NTP Connect Fail, IP Conflict, Network Link Down
Config	☒	☐	Login Fail, IP Changed, Password Changed, Config Changed, Firmware Upgrade, SSL Certificate Import, Config Import, Config Export
OpMode	☒	☐	Connect, Disconnect, Authentication Fail, Restart

- To view events in the system log, log in to the HTTP/HTTPS console and select **System Monitoring > System Log**.

4 Patching/Upgrades

4.1 Patch Management

Regarding patch management, Moxa releases version enhancements annually with detailed release notes.

4.2 Firmware Upgrades

The process for upgrading firmware is as follows:

- Download the latest firmware and software along with its release notes and hash values for your NPort device from the Moxa website:
 - Firmware for NPort 6100/6200 Series:
<https://www.moxa.com/en/products/industrial-edge-connectivity/serial-device-servers/terminal-servers/nport-6100-6200-series#resources>
 - Firmware of NPort 6400/6600 Series:
<https://www.moxa.com/en/products/industrial-edge-connectivity/serial-device-servers/terminal-servers/nport-6400-6600-series#resources>
- Moxa's website provides the SHA-512 hash value for you to double-check if the firmware is identical to the one on the website.

- Log in to the HTTPS console and select **System Configuration > Firmware Upgrade**. Select the **Choose File** button to select the proper firmware and then **Submit** to upgrade the firmware.

Note Because of memory limitations, the firmware structure of the NPort 6000 Series is being fine-tuned. As a result, we cannot upgrade the firmware of NPort 6450 to v2.0 from v1.21 via the web console. To upgrade the firmware, use DSU or MCC Tool (Moxa CLI Configuration Tool).

- If you want to upgrade the firmware for multiple units, download the Device Search Utility (DSU) or MXconfig for a GUI interface, or the Moxa CLI Configuration Tool for a CLI interface.

FILTER		Operating System	All	Driver	Firmware	Library	Software Package	Utility
NAME	TYPE	VERSION	OPERATING SYSTEM	RELEASE DATE				
Moxa CLI Configuration Tool for Linux 8.1 MB	 Utility	v1.2	- Linux Kernel 2.6.x - Linux Kernel 3.x - Linux Kernel 4.x	Mar 31, 2021 Release notes				
Moxa CLI Configuration Tool for Windows 2.1 MB	 Utility	v1.2	- Windows 10 - Windows 7 - Windows 8 Show More	Mar 31, 2021 Release notes				
Device Search Utility 1.1 MB	 Utility	v2.4	- Windows 10 - Windows 2000 - Windows 7 Show More	Mar 31, 2021 Release notes				
PComm Lite - Serial Communication Tool for Windows 1.6 MB	 Utility	v1.6	- Windows 2000 - Windows 7 - Windows Server 2003 Show More	May 13, 2012 Release notes				
MXconfig 118.1 MB	 Software Package	v2.6	- Windows 10 - Windows 7 - Windows 8 Show More	May 29, 2020 Release notes				

- If you need instructions on using the Moxa CLI Configuration Tool, download the manual.
 - Manual for the NPort 6100/6200 Series:

5 Security Information and Vulnerability Feedback

As the adoption of the Industrial IoT (IIoT) continues to grow rapidly, security has become one of the top priorities. The Moxa Product Security Incident Response Team (PSIRT) is taking a proactive approach to protect our products from security vulnerabilities and help our customers better manage security risks.

Follow the updated Moxa security information from the link below:
